GENESIS
The epic novel
of the world's most fearsome secret
W. A. Harbinson

The epic novel of the world's most fearsome secret

More than a gripping, enthralling novel of

brain-searing excitement, Genesis is a

reading experience you will never forget…

In these pages you will enter a world of nightmarish global conspiracy and perverted super-science that will both horrify and fascinate you. You will see the hidden forces of technological evil massing to obliterate those who threaten to reveal their appalling existence. And, in the totally unexpected and chilling climax, you will witness one of the most powerful testaments to the strength of the human spirit in adversity ever to appear in a work of fiction…

'A Herculean conspiracy epic… superbly written, crammed with food for thought.'

November 23, 1944

It began when the B-25 had crossed the Rhine and was starting to make its bombing run over darkened Germany. The other aircraft had already made their first run when Lieutenant Tappman, twenty-one years of age and out

of Denver, Colorado, studied the cross hairs of his bombsight, watched the last of the indices join, and prepared to trip away his load of five-hundred pounders.

The first bombs were already exploding, tiny flames in the black void, the flat drifting far below, the tracer bullets like fireworks, when Tappman blinked and saw the pulsating red lights winking on and then vanishing. 'What the hell – ?' the pilot said. 'Jesus Christ!' a gunner added. The intercom crackled, voices rising and falling, then the Plexiglas nose was briefly filled with crimson light as three globes of spinning flame shot up vertically and vanished above.

Tappman blinked and shook his head, heard the coughing of the engines, felt the aircraft shuddering strangely and levelling out and heading away from the target zone. A spasm of fear lanced through him, an instinctive dread of the unknown, and he promptly pressed the button on his throat mike and said, 'What the hell's happening there?' The intercom crackled. 'What was *that*?' The copilot said. 'I don't know,' the tailgunner replied. 'I saw lights – three red lights.' Tappman looked into his bombsight, saw the cross hairs over darkness, cursed softly when the engines malfunctioned and the plane shuddered again. 'You're going off course!' he shouted. 'What the hell are you up to? I can't see a damned thing from here! Is it enemy aircraft?' The plane shook and dropped again, climbed back up, levelled out, the intercom crackling, metallic voices colliding. '*Red lights! Something burning! No, they're climbing! Jesus Christ!*' And then Tappman was dazzled, the night filled with spinning flames, and the burning globes spread out around the plane and then started to pace it.

The plane shuddered and rolled, went into a shrieking dive, barrelling down through streams of tracers and black mushrooms of flak, the blazing buildings of Germany far below, illuminating the darkness. 'Pull her up!' Tappman bawled his eyes blinded by purple flares. 'What the hell's going on? We're cutting out! *We're down, you dumb bastards!*' The plane roared and shook violently, levelling out, its wings quivering, and Tappman saw his jack-plug dangling loose and jammed it back into the intercom. 'They're still with us!' the pilot was shouting. 'What *are* they?' the gunner wailed.

The nose shuddered and pointed upward, heading through the tiers of flak, the plane's engines sounding healthy again as it started to climb.

Tappman looked for the balls of fire, saw nothing, rubbed his eyes, felt isolated in the bombardier's compartment at the end of the crawlway. 'What are you doing?' he bawled, seeing yellow fires below, the ugly black clouds of flak around him, hearing muffled explosions. 'We cut out!' he shouted. 'We went dead! *What's going on out there?*'

The intercom crackled, the tailgunner's voice wailing, fading in and out, back in again, sounding close to demented. 'What are they?' the gunner wailed. 'They're right beside me! I can't hit them! I can't make them out! They're not conventional aircraft! *What the hell are those things?*'

Tappman cursed and glanced around him, not believing what he had seen, wishing he could see them again, filled with dread and excitement. '*What?*' the pilot bawled. 'Spinning balls!' the gunner wailed. 'Balls of fire! I'm not sure! They look like balls of fire and they're spinning! Oh, my God, *now there's more of them!*'

A sudden silence, then the static, then the roaring of the guns, someone screaming and then the plane rolling as if out of control. Tappman cursed and shook his head, glanced up to see the sky, the dark clouds and the smaller clouds of flak, the silvery web of the tracers. '*Drop the bastards!*' the pilot bawled, wanting the bombs to be released, wanting his plane to be freed of its load and climb out of the chaos. '*I can't!*' Tappman whispered, working the controls to no avail, the fear racing back in to smash his senses when the engines cut out again. '*We're going down!*' someone screamed.

The plane shuddered and went silent, started rolling, falling fast, Tappman trapped in the nose cone with the Earth far below him. He heard the static, someone wailing – the tailgunner or copilot – and looked below, following the line of the falling plane, to see the fires of the air raid. 'What *are* they?' the gunner cried. 'The engines are dead!' the pilot bawled. 'They're not planes!' the gunner cried. 'They're balls of fire! Jesus Christ, *now they're climbing!*'

The engines roared back into life, as if controlled by the balls of fire, the plane levelling out and heading through the tracer bullets and the black clouds of flak. Tappman groaned and licked his lips, simply forgot to release his bombs, jerked his head around and saw a crimson light that fanned out across the dark sky. '*What's that?*' Tappman shrieked, not recognising his own voice, his heart pounding as he searched for the German fighters and saw only the crimson light. 'I don't know! the pilot bawled. 'They're right behind us!' the gunner screamed. 'They're pacing us!' the copilot joined in, his voice high and distorted. '*They're killing our engines!*'

Tappman glanced all around him, closed his eyes, looked again, saw the crimson glow spreading across the darkness at the side of the nose cone. Then the engines malfunctioned, started spluttering into silence, coughed into life once again and made the plane jerk unnaturally. Tappman shrieked some mindless plea, hardly aware of his own voice, staring out through the glinting Perspex to see a strange ball of fire. 'Jesus Christ!' he whispered to no one, his eyes wide and disbelieving, seeing that spinning ball of fire, then another, then a third, suddenly recalling all the stories he had heard and never believed. '*Foo fighters!*' the gunner screamed, his voice distorted by the intercom, reverberating in Tappman's head and then fading away as the plane hurtled Earthward.

'We're going down! *Pull her up!*'

Tappman grabbed hold of himself, closed his eyes, embraced the nightmare, felt his body being pressed back into the chair as the plane kept on falling. The plane fell an endless mile, shuddering violently, spinning wildly, but it reached the ground eventually, plunging into it, exploding, Tappman hearing a crazed voice wailing '*Foo!*' which is where it all ended.

Chapter One

Shortly after noon on March 6, 1974, a battered, two-toned Pontiac passed through the gates of Winslow Air Base, Arizona, and headed directly for the Air Traffic Control Tower. The car moved leisurely but smoothly past the administration blocks and hangars, sunlight flashing off its windows, its

wheels churning up red dust, the soft droning of its engine drowned out by the roaring of the aircraft either taking off or landing. There were white clouds in the blue sky, the planes glittered above the mountains, and the clouds were like banks of pure snow in a clear, azure lake.

When the car eventually stopped at the glass-and-concrete control tower, the driver climbed out slowly, closed the door with some care, locked it, then glanced keenly around him. This man was short and broad, insignificant in his dark suit, his white hair dishevelled and his green tie hanging loose, the tanned fingers of his right hand reaching up to stroke a grey Vandyke beard. He was no longer run, was in fact just over sixty, and his face was a sunburnt webbed map of reflection and fatigue.

After glancing briefly at the surrounding mountains, the man reached into his jacket pocket, withdrew a billfold, flipped it open and dangled it before the civilian guard. The guard was tall and impassive, dressed in black shirt and pants, and he studied the identity card, fingered the holster on his hip, distractedly stroked the peak cap on his head and then nodded assent. The old man smiled bleakly, returned his billfold to his pocket, winced when an airplane roared overhead, passed the guard, went inside.

The stairs were made of concrete, uncovered, painted white, and they led up through silence and a dim half-light to the more pronounced semi-darkness of the Approach Control Room. The old man glanced at the elevator, considered it, rejected it, took a deep breath and climbed up the stairs, breathing fitfully, wearily. Finally reaching the top, facing a steel-plated door, he let his racing heart settle, tightened the knot in his tie, buttoned his jacket and then pushed the door open and closed it quietly behind him.

The Approach Control Room was dimly lit, the numerous radarscopes flashing, the walls banked with computers and flight maps and schedule charts, the air traffic controllers bunched around the consoles, hair short, sleeves rolled up. The old man blinked and coughed, his hazel eyes scanning the gloom, then he raised one hand and distractedly stroked his beard, the noise and dim light confusing him. The air controllers all talked at once, telephones rang, radios crackled, and the colored lights of radarscopes and computers flashed on and off constantly.

The old man coughed again, raised a hand and waved it languidly, watched his friend detaching himself from a group and coming toward him. His friend was young and flashy, his flowered shirt open-necked, the chain belt on his white trousers gleaming as he shook the old man's hand. He did this and then stepped back, glanced around him, grinned and shrugged, then stepped forward again, took the old man by the shoulders and shook him affectionately.

'You look good,' he said.

The old man smiled wearily, smoothed his thinning grey hair, looked around him, eyes squinting, bathed in muted orange light, stroked his beard and then loosened his tie and looked back at his younger friend.

'I don't feel as good as I look,' he said. 'Now what's this emergency.'
'I'm sorry I had to – '
A weathered hand waved. 'It's all right,' the old man said. His accent was faintly European, his voice soft, almost hesitant. 'Just tell me what's happening.'
The younger man was slow to answer, his fingers playing with the gleaming belt, He glanced uneasily around him and then reluctantly looked back at the older man.
'We found Irving,' he said.
Something happened to the old man, something almost imperceptible, a spasm of shock, a fleeting fear or despair, before he blinked and automatically stroked his beard and then regained control again.
'You found him?'
'Yes, Frederick. He's dead.'
The old man looked at the floor, rubbed his eyes, glanced around him; he saw the glowing radarscopes, their orange light on men's faces, the men casting long shadows on the floor, on the humming computers. He felt fear at that moment, the dry, familiar fear, a helpless dread that had enveloped his past and now mapped out his future. He looked back at his young friend, at the blond hair and blue eyes, saw the multicolored darkness all around him, making him unreal.
'Suicide?' the old man said.
'So it seems, Frederick. They found him an hour ago, on U.S. 66 – in his

car, just beyond Valentine, a gun in his hand.'
'U.S. 66?'
'That's right. Apparently Mary never even saw him leaving. She's staying in the house on Camelback Hill, and I just rang her and she didn't sound well.'
'No,' the old man murmured. 'Obviously not.'
'Anyway,' the young man said, 'the usual. Mary says he hadn't been sleeping well lately, that he'd been getting up in the middle of the morning and just wandering about the house, looking out the windows, looking up, obsessed by the whole thing. She thinks he must have done that this morning – got up when she was asleep – only this time he didn't wander around: he took their car and drove off. The cops found him an hour ago. He'd shot himself in the mouth. I told them to hold off till we got there. We better go now.'
The old man closed his eyes, shook his head from side to side, opened his eyes again and glanced around him, his face taut with grief.
'Poor Mary,' he whispered.
The young man took his elbow, led him out of the control tower, down the stairs, through the door, past the guard, around the dusty old Pontiac. The noon sun blazed down upon them, upon the airstrip across the road, burned a monstrous white hole in the sky above the hazed, blue-ridged mountains.
'We'll leave your car here,' the young man said. 'We won't be gone very long. We'll just fly out there and find out what we can and then I'll bring you right back.'
The old man stroked the Pontiac, wiped the dust from his hand, glanced across the baked plain, eyes squinting against the sun, then dutifully followed the young man. The air base was busy, planes taking off and landing, a constant noise and movement above them as they crossed the hot tarmac. The old man was sweating, mopped his forehead, felt the wind – a fierce wind that emanated from a roaring and made his eyes narrow even more. His young friend was just ahead, ducking low, waving frantically, urging him on toward the red-andwhite 47G helicopter that had just burst into life on its landing pad.
The rotor blades whirled, becoming a blur that whipped the dust up, turning the dust into a localized whirlwind that enveloped the old man. He almost stumbled, righted himself, covered his mouth and cursed softly, then his free hand held his jacket against his chest as he followed his friend.

The helicopter roared and shuddered, its short steel ladder rattling, and the younger man, already inside, reached down with one hand. The old man was pulled up, slipped in behind the pilot, and promptly strapped himself into his seat as his friend closed the door. Then his friend sat down beside him, the helicopter shook and climbed, and the old man, visibly relieved, stared out through the Perspex.

He felt grief and outrage, an uncoiling, chilling fear, looking down, Winslow shrinking below him, remembering other days, other deaths. Suicide, he thought. We all finally commit suicide. There is never a reason nor a motive, but it's always a suicide. Of course he didn't believe it, never had, never would. He looked down on the mountains, on the barren, rock-strewn earth, on the saguaros and ocotilla and barrel cacti, and felt the fear creeping over him.

'How do you feel?' the young man said.

'About what you'd expect.' The old man stroked his beard and rubbed his eyes. 'I feel for Mary. How awful.'

The helicopter dipped and climbed, sunlight flashing all around it, and the engine made a fierce, relentless roaring that drummed in their ears.#

'We have a flap on,' the young man said. 'That's why I'm out at the air base. There's been sightings all over the goddamned place, and they're keeping us busy.'

The old man stared through the Perspex, saw the buttes and windcarved valleys. 'There's been a flap for the past *fifteen months*,' he said, now looking sideways, smiling gently.

'White Sands,' his friend continued. 'Los Alamos and Coolidge Dam. Visual sightings and radar reports, all unidentified returns solid.' He shrugged his shoulders, ran his fingers through his blond hair. 'I don't know,' he said. 'It kinda makes me shiver. These things know where they're going.' He looked at the old man. His bearded friend did not respond.

'Weird,' he said. 'So how did your year go? How are things at the institute?'

The old man sighed. 'Very busy,' he said. 'It's been the biggest flap since 1967 and we haven't had breathing space.'

'Anything solid?'

'Too many to discuss.' The old man saw mountains far below, the desert stretching around them. 'I just wish we could catch one.'

The young man smiled. 'I want to pay you a visit,' he said. 'But you keep all these things in your head; fill me in just a little.'

‘There were hundreds,’ the old man said. ‘Every conceivable kind. High-level, low-level, distant, actual contact; electrical and mechanical interference, numerous car-chasing incidents; mental and physical effects on people, animals similarly affected; landings with genuine traces left behind, the materials still unidentified. So, there were plenty.’
‘Jesus,’ the young man said. ‘Jesus Christ.’
‘Good witnesses,’ the old man said. ‘All reliable witnesses. We’ve never had such quality before. Most encouraging. Quite heartening.’
‘Irving said that.’
‘Irving’s dead,’ the old man said. ‘Irving told me he had found something important… now Irving is dead.’
‘I can’t hear you,’ the young man said.
‘Alright, I’m sorry.’
‘Tell me about some sightings,’ the young man said. ‘Who in hell are your witnesses?’
‘Policemen,’ the old man said. ‘We’re running a survey on police sightings. A policeman isn’t prone to hysteria and he’s trained to observe.’
The old man stroked his beard, offered a sigh, studied his hands. The helicopter roared in his ears, making his head throb.
‘October 17, 1973,’ he said. ‘In Waverly, Illinois, in the early hours of the morning, the police chief and three citizens observe an object with green-and-red flashing lights. They watch the object with binoculars for an hour and a half; it gives out glowing embers that fall to the ground, then disappears as abruptly as it arrived… Los Angeles: police officers are summoned to investigate an object on the east side of the city; on arrival the officers see an oblong, bluish-white, very bright object which, when their car moves toward it, rises at a fortyfive degree angle to an altitude of about fifteen hundred feet and then speeds off… Palmyra, Missouri: several high-school students report that a bizarre object with flashing lights has appeared over the Missouri River, beamed a spotlight on a passing barge, lit up the entire river bottom, circled the river quite a few times, and approached onshore spectators before taking off vertically and disappearing. Four days later, Palmyra citizens *and* police observe an object with red, white and amber lights on it, plus two powerful headlights in front; this object silently and slowly circles the whole town at low level, and only when police officers shine a spotlight on it does it finally move away and disappear…’
‘Okay, you’ve convinced me.’ The younger man grinned, shook his head

from side to side, glanced sideways at the old man, looked away, saw the silvery-blue sky. ‘Any contact? Anything verifiable?’
‘Not with the police.’
The old sighed, a muted hint of defeat, played distractedly with the collar of his rumpled shirt, his hazel gaze on the desert. The helicopter was vibrating, roaring and rattling about him, lifting up and then dropping down again in a sickening fashion. The old man kept looking down, seeing the mountains and valleys, the red earth, the scorched, writhing rocks, a world untouched by time… No, that wasn’t so: nothing there had remained untouched. He looked down on Two Guns, Winona, Humphrey’s Peak, thought of all that had lived there and passed away because it no longer mattered. The land below was haunted, the dust settling over history, erasing the Apache and the Mojave, the Papago and the Pima, the Hopi and the Hualapai and the Yavapai, the Maricopa and Paiute. The Spanish *ricos* had disappeared but lonely missions remained, their walls bleached by the sun and eroded by fierce, abrasive winds, their ancient bells red with rust. Arizona was unreal, a dream of legend and myth, its prairies crossed by Kit Carson and Billy the Kid and Wyatt Earp, still sheltering the reservations and pueblos, the sad remains of the Indians. The old man stared down and shivered, felt the clinging, familiar fear, tried to reconcile the past with the present and its possible future. He thought of the White Sands Proving Ground, of Alamogordo, New Mexico, of Los Alamos and what it represented: the ever-threatening Atomic Age. Yes, the future was here and now – in aeronautics and atomic research. It was also in the lights in the sky that now obsessed the whole world.
‘There has of course been contact,’ the old man said. ‘Bu, alas, not with policemen.’
‘The Air Force?’
‘Doubtless. But no announced.’
‘No. Those bastards wouldn’t.’
The old man stroked his beard, looking more tired each minute, a slight, almost imperceptible shiver running down through his body.
‘Still,’ the young man said, ‘I think we’re becoming more respectable. Did you know that on 21 February this year Monsieur Robert Galley, the French Minister of Defence, gave an interview on *France-Inter* in which he stated categorically that UFOs exist, that the phenomenon over France was massive, that they were considered of definite interest to national defence,

and that since 1970, in collaboration with the *Gendarmerie*, all information regarding French sightings has been passed over to the *Groupment d'Etudes des Phenomenes Aeriens* for investigation? I also note that this very month the American Institute of Aeronautics and Astronautics has revitalized its UFO committee. So, not to pun, things are looking up.'

The old man seemed lost in thought, fingers scratching at his beard, looking slightly impoverished beside the more colorful presence of his younger friend. When he finally spoke, his voice was soft and remote, as if divorced from him.

'I'm tired,' he confessed. 'I'm growing old and I'm tired. I've been at this business for twenty-five and I've had too many friends kill themselves. I'm not tired. I'm just frightened.'

His young friend did not reply, merely gazed down at the desert, momentarily embarrassed into silence, knowing what the old man meant.

'You've heard of Calvin Parker and Charles Hickson?'

'Yes,' the young man said. 'The Pascagoula case.'

'Remarkable,' the old man said. 'The publicity was astonishing. A close encounter of the third kind that even Hynek was inclined to believe. When was that? Was it last year?'

'Yes,' the young man said. 'You've got the year right. The mouth of the Pascagoula River in Mississippi. A hell of a buzz.'

'Some can't be broken down,' the old man said. 'Some are just beyond reasoning.' He closed his fist and coughed into it, shook his head as if disgusted, rubbed at his eyes and glanced down, saw the stark, shadowed mountains. 'Route 114A near Manchester, New Hampshire. November, 1973, at four in the morning. Driving home from work, a twenty-five year old woman – checked out, highly intelligent – notices a bright orange light that repeatedly vanishes and reappears in the sky ahead. About seven miles farther on, the object is much closer than before, much lower, much larger. Estimated as being about sixteen hundred feet in front of her, it is ball-shaped and honeycombed with various hexagons. The object has a translucent quality about it, with red, green and blue rays emanating from its center; and it is making a steady, high-pitched whining sound that makes her whole body tingle. Briefly, as follows… Though frightened, the woman is unable to remove her hands from the steering wheel and feels that the object is somehow drawing her car toward it. There is a memory-loss during a half-mile stretch. Recovering, the woman finds her car hurtling at

the object, which is now about thirty feet above the ground. Still driving, and about five-hundred feet from the hovering object, the woman notices a widow and an occupant inside, the occupant framed waist-up by the window. Description: head greyish, round, dark on top; eyes, large and egg-shaped; skin under the eyes loose or wrinkled. The witness didn't notice any eyes or ears, though this may not mean anything… The witness seemed to be genuine.' 'Any trace cases?'
'Too many to recount.'
'Actual contact?'
'Yes, your Pascagoula case.'
'That,' the young man said, 'was a humdinger.'
'Greyish skin again. Conical appendages for nose and ears. Round feet and hands, crablike claws, lot of wrinkles, no eyes recalled.'
'But five feet tall.'
'Yes.'
'Almost human.'
'That's right. Almost human…'
The old man's voice trailed off, was drowned out by the roaring helicopter, which was turning and dipping toward the earth, sunlight flashing around it. The old man felt ill, his stomach rumbling, heart fluttering, as he looked down on Dinosaur City, a gleaming maze in the desert.
'We'll soon be there,' his young friend said.
'Good,' the old man said. 'I want to get this over and done with. I'm not as young as I used to be.'
'Well, you're still working. You've kept the institute going. I'm glad you haven't given up yet. You're doing valuable work there.'
'I hope so. I'm not sure. We can only do a limited amount. On the other hand, we *are* more organized these days – and nowadays they cooperate.'
'The Air Force?'
'Yes. To a certain extent. However, what's more important – indeed, as you've just said – is the fact that witnesses from all walks of life are coming forward more willingly. The crank reports are now almost at zero, while reports from flight personnel, astronomers, and even astronauts, are being received at an astonishing rate. We now have a computer data bank for analysis of reports and storage of information. Areas covered include medical examinations of people and animals affected, psychological studies of witness reliability, theoretical studies of UFO movements and properties,

photographic and special graphic analysis of UFOs, and analysis of plants that a UFO may have affected. In short, we're covering the subject pretty thoroughly.'
The young man smiled, flicked blond hair from his blue eyes, glanced briefly at the pilot in front, then looked again at his older friend.
'I believe it,' he said.
'And now Irving.'
'Jesus Christ… yes… I'm sorry.'
They fell silent after that, both plunged into gloom, each locked into his personal concept of what might have happened. The helicopter rolled and dipped, started shuddering and falling, and looking down they US 66, curving back toward the mountains. The old man rubbed his eyes, the sun dazzling him, blinding him, then he reached for the knot in his tie and nervously tightened it.
'There they are,' his friend said.
The old man looked down, saw the dark line of the road, a ribbon winding around buttes and through valleys, shades of green, rose and lavender. Panic came and then departed, left him drained and forlorn, silvery sunlight exploding around him and then disappearing, leaving blue sky, white haze, a flock of dark birds, a jagged barrier of mountains in the distance, a stream of dense clouds above them.
The taste of death and its aftermath; the accumulation of fresh pain… His heart pounded and he let the fear depart and opened himself to his anger. He was old, most assuredly, growing older every, but gazing down upon the highway, seeing it widen and rush up toward him, seeing the police cars and the ambulance and the men around the other car, he let the rage wash away his grief and fear and charge his blood with new life. That was Irving down there. Back in Phoenix, Mary wept. The old man coughed and muttered and oath and sat back looking grim.
'I don't believe this,' he said.
The helicopter dropped lower, roared louder, shuddered violently, brown rock and parched grass and yellow cacti racing up to enfold it. Looking down, he saw the police cars, the ambulance, the milling men, the latter staring up, waving hands, shading eyes, the red dust being swept up by the helicopter and swirling around them. The helicopter moved on, crossed the road, still ascending, and then settled down a couple of hundred yards from the road. There was a bump, a brief shaking, a creaking subsidence, then

peace, the engine whining into silence, the rotor blades finally stopping.
'Okay, you guys,' the pilot said loudly. 'Here we are. It's all yours.'
The young man with the blond hair and colorful clothes unsnapped his safety belt and stood up. The old man was slower, fumbling clumsily with his belt, finally managing to unsnap it and rise, breathing harshly, laboriously. There was a rattling and banging, a beam of sunlight poured in, then the pilot slid the ladder through the doorway and motioned them outside. The young man went out first, held his hand up to the older man, took his elbow and guided him down the ladder to the safety of solid ground. The air was filled with swirling dust. The old man coughed and blinked repeatedly, shaking his eyes with one hand; he felt the sudden, claustrophobic, burning heat and then followed his young friend. They kicked sand and trampled shrubs, saw a lizard, a line of ants, then they arrived at the edge of the road and saw their friend, Irving Jacobs.
Irving was in his car, his face flattened against the steering wheel, the back of his head blown away, a bloody mess all around him. His arms hung down by his sides, the wind rippling his shirt-sleeves, and his face was turned slightly toward them, staring at them with dead eyes.
'Oh, my God,' the young man said.
The old man said nothing, simply shuddered and turned aside, tightened his tie and then took a deep breath and looked slowly around him. He saw police cars, the ambulance, the white-clad medics, the milling cops, then a fat man wiping sweat from his forehead walked over to him.
'Stanford?'
'No, I'm Stanford.' The young blond man stepped forward. 'I'm sorry to have kept you all this time. I had a bit of a hold-up.'
The fat man stared at Stanford, wiped from sweat from his face; he was big, but that didn't stop his gut from flopping over his belt.
'I'm Toland,' he said. 'Captain Toland. Homicide. I don't know what you birds want out here, but you better be quick. He's startin' to stink already. He's been cooked by the sun. He shot himself early this morning. Put the gun in his mouth.'
'*What gun?*' the old man asked.
'Who are you?' Toland said.
'I'm sorry,' Stanford said. 'This is Dr Frederick Epstein. Of the Aerial Phenomena Investigations Institute in Washington. I told you I'd bring him.'

‘Washington, eh?’ Toland said, mopping sweat from his brow. ‘He must be a big fish.’
‘Not big at all,’ Epstein said. ‘He was just a close friend. Now what’s this gun you’re talking about? My friend didn’t own a gun. In fact, he didn’t even know how to shoot one. I can assure you of that.’
‘You don’t have to know how to shoot one to blow your own head off.’ The captain pulled out a handkerchief, mopped the back of his neck, glancing around at the cops taking measurements and photographing the dead man. ‘You just unclip the safety catch,’ he said, looking down at Dr Epstein, ‘and stick the barrel in your mouth and squeeze the trigger. That’s all there is to it.’
‘He didn’t own a gun,’ Epstein repeated stubbornly. ‘He wouldn’t have known where to buy one.’
‘What are you, Doc? A scientist?’
‘That’s right. I’m a scientist.’
‘You sound pretty melodramatic for a scientist. You can buy a gun anywhere.’
Epstein glanced at Stanford, saw him shrugging his shoulders; he glanced briefly at the dusty red Ford: at the policemen around it. The cops were dressed in tan, wore dark glasses and brimmed hats, seemed threatening with their pistols and clubs, murmuring jokes, laughing raucously. Epstein saw the side of the car, the door open, an arm dangling. Beneath a limp hand the sand was stained with a patch of dried blood. Epstein shuddered and turned away, felt anguish and choking rage, rising out of himself and floating back to take a grip on his future. Captain Toland was staring at him, towering above him, gazing down, his fat face burned by sun and desert wind, his shirt rumpled and sweat-soaked.
‘It was a Luger,’ Toland said. ‘A German Luger. We’ve wrapped it up for the lab boys.’
‘He wouldn’t have bought a gun,’ Epstein said.
‘Then he stole it,’ Toland said. ‘He got a Luger and he shoved it into his mouth and that’s all there is to it.’
‘I don’t believe that,’ Epstein said.
‘Jesus Christ,’ Toland said. He turned his head and looked appealingly at Stanford. ‘The Doc thinks it was murder.’ The thought clearly amused Toland, made him grin and scratch his belly; then he turned back to Epstain, held his shoulder, and said, ‘Here, come with me, Doc.’

They went around some lounging cops, past the ambulance, toward the Ford, Epstein feeling a deep surge of revulsion at the sight of that dangling arm. Then he looked down at his friend, saw the bloody, shattered head, turned aside and lowered his gaze to see a dark stain on red earth.
'Don't look at him,' Toland said. 'Just take a good look around you. Tell me what you see or what you don't see. Just have a good look.'
Epstein did as he was told, a small man, tired and grim, rubbing nervously at his beard and looking around him, his hazel eyes lined with age. The desert lay there before him, scorched eternally by the sun, rolling away between the buttes, into valleys, the distant mountains in blue haze. Stillness. Desolation. His gaze returned to the men around him. The medics had taken a stretcher from the ambulance and were advancing on the dusty red Ford. They dragged Epstein's friend out, a dead thing, meat and bone, and he choked back his revulsion and rage, looked once, turned away again. The sky, the white clouds, the ochre mountains beneath them; the mountains fell to the wilderness floor that stretched across to his feet.
'I don't know what you mean.' He said.
Toland sighed with satisfaction, twisted his body, glanced around him, then waved one hand languidly at the road, at the tracks of the vehicles.
'Those tracks there,' he said. 'The tracks right in front of you. They belong to your friend's car and there isn't the trace of a skid mark: he drove up here and stopped.' Toland waved his hand again, indicating more tire tracks – tracks criss-crossing each other and spread out to the police cars and ambulance. 'He was found by our patrol car. There were no other tracks here. Those tracks you see belong to our vehicles – before we came, there was nothing. Just one set of tracks – your friend's tracks – there were no other vehicles. Our own car was the first to find him. No other cars had passed this way. No tire tracks, no footprints. No nothing. He did it all on his own, Doc.'
Epstein didn't reply, simply stood there deep in thought, his unfocused eyes becoming more alert when they fell on the medics. They were at the rear of the ambulance, one inside, one on the ground, Irving Jacobs strapped tightly to the stretcher that was tilted between them. Dr Epstein stepped forward, touched his friend's face with his fingertips, shook his head from side to side as if bewildered, then stepped back and just watched. The stretcher was hoisted up, the gleaming doors were slammed shut; the remaining medic ran around to the driver's seat and waved once and climbed in. The

ambulance roared into life, the wheels churned the dust up, then it reversed and turned around and moved off along the desert road. Epstein watched it departing, didn't move until it was gone, then he sighed and returned to young Stanford, who was looking perturbed.
'Jesus,' Stanford said, 'that was awful. How the hell could he do it?'
Epstein opened his mouth to speak, changed his mind, shrugged forlornly, glanced around and tightened his lips with distaste when Captain Toland approached him.
'That's it,' Toland said. 'We're going back now. They'll do the autopsy in Phoenix. You have any more questions?'
'No, Captain,' Stanford said. 'No more questions. Thanks for your help.'
'No sweat,' Toland said, the sweat pouring down his face, dabbing at his neck with the handkerchief, his grin directed at Epstein. 'It's all part of the service.'
He turned away and walked off, his broad hips rolling rhythmically, a pistol slapping up and down on one fat thigh, flicking sweat from his brow. The other cops were in their cars, the cars reversing in clouds of dust, then screeching, wheels churning up more dust as they burned off down the road. Toland turned back and waved, his flushed face split by a grin, then he clambered awkwardly into his own vehicle and it rumbled away. Stanford stood beside Dr Epstein. They watched the cops drive away. They waited until all the cars had disappeared in the distance, then they turned, the dust settling around them, and walked back to the waiting helicopter.
'Okay?' the pilot asked.
'Okay,' Stanford said. 'Homeward bound.'
They strapped themselves into their seats and Epstein loosened his tie, wiping sweat from his neck with his hand as the helicopter took off. They ascended toward the sun, the sky dazzling, a blinding haze, Epstein glancing down on Route 66, the drifting dust of the wilderness.
'How's your love life?' Epstein asked.
'Pretty regular,' Stanford said.
'You're picking up a bad reputation.'
'I know it. I love it.'
'I thought you were marrying some girl.'
'Yes, I was. I just changed my mind.'
'You could never make decisions,' Epstein said. 'That's your major weakness.'

Stanford grinned and nodded agreement. Epstein smiled and patted his arm. The helicopter climbed higher, the land spreading out below, and Epstein suddenly leaned forward, his eyes widening, filled with shock, and reached out to take Stanford by the shoulder and shake him impatiently.
'Your flap!' he snapped. 'New Mexico and Arizona. You mentioned the Coolidge Dam.'
'That's right,' Stanford said.
'Any more?' Epstein snapped. 'Apart from Coolidge! *Did you have any more?*'
Stanford was startled. 'Shit, yes,' he said. He stared hard at his old friend, at his flushed, impatient face, and was taken aback to see the brightness in his eyes, an almost feverish intensity. 'All over the place,' he said. 'A constant flap the past three days. Over Glendale, over Prescott, over Tucson and Eloy, over Flagstaff and Sedona and Sunset Crater – the whole goddamned show.'
'*Look down there!*' Stanford hissed.
Stanford looked down. He saw US 66. He saw the spot where Irving Jacobs had been found, the rocky earth all around it. Then he blinked and looked harder. A shiver ran down his spine. He suddenly saw the rippling soil, the concentric rings of dust and sand, the rings surrounding the spot where Irving had been found and running out a great distance. It was like the thumbprint of a giant, the rings like whorls on the earth, as if the dust and sand had been blown away by some awesome explosion. Stanford blinked and looked again. He couldn't believe what he was seeing. The thumbprint was half a mile in diameter, the earth scorched at its edges.
'Oh, my God!' Stanford said.
The helicopter climbed higher, turning away from the sun, and neither Stanford nor Epstein said a word as they flew back to Winslow.

Chapter Two

The man who stepped off the luxury cruiser onto the Puerto Banus yacht harbour near Marbella, southern Spain, was tall and sophisticated, wearing a black shirt and slacks, his eyes hidden behind dark glasses, his hair silvery but plentiful, parted neatly on the left and falling down over an oddly seamless forehead. He stood briefly on the dock, surveying the massed boats of the rich, then he turned in a sharp, decisive manner and walked

alongside the many restaurants. Most tables were taken, the clientele suntanned and elegant, wearing bikinis and gaudy shirts and sunglasses, gazing up at the mountains' haze. The man in black ignored them, walking slowly and thoughtfully, only stopping when he arrived at the Sinatra Bar, looking in, entering warily.

The interior was bright and cool, almost empty, quiet, one young lady at the far end of the bar, a single man near the entrance. This man was middle-aged, rather plump, dressed in a white suit, the jacket bulging slightly just above his left hip where a pistol was undoubtedly strapped. He glanced up and grinned, a practised smile, nervous, then he lightly patted the high stool to his left, his fingers glittering with rings.

'Ah,' he said, 'Mr Wilson!'

Wilson nodded curtly, but remained in the doorway, removing his glasses and blinking azure eyes, staring along the bright room. The young woman was tanned and lovely, blonde hair trailing down her spine, breasts and crotch emphasized by her bikini, the long legs crossed invitingly. Wilson stared at her, studied her, saw the indolence of the rich, and then, satisfied that she was harmless, he stepped forward to take a high stool beside the white-suited man.

' *Buenas días*,' the white-suited man said. 'It's been a very quiet time, *señor*.'
'That sounds promising,' Wilson said.
'I think so, Mr Wilson. There's been nothing unusual at all. The

work's all been routine.'
'No visitors?'
'Not a knock on the door.'
'I feel better each minute.'
A short, dark Spanish girl emerged from a door behind the bar;

seeing Wilson, she started moving towards him. Wilson smiled pleasantly, but shook his head from side to side, and the girl, with a slight, knowing nod, turned away to clean glasses.

‘You’re not drinking?’ the man in white said. ‘Your trip didn’t give you a thirst?’
‘Not for wine, Fallaci. Just for rest. I am here to relax.’
Fallaci nodded and sipped his *vino*, his rings glittering around the glass, then he glanced at the young lady along the bar and slowly turned back to Wilson.
‘I had a telephone call this morning. From our friends in Arizona. They said to tell you that Irving Jacobs is dead. It’s been announced as a suicide.’
‘How unfortunate,’ Wilson said. ‘At least for him. I would like to leave now.’
Fallaci licked his lips, turned away and snapped his fingers, causing the Spanish girl to smile and walk up to him, blue-jeaned hips swaying sensually.
‘*Cuanto*?’ Fallaci said.
‘*Ciente pesetas*, *señor*.’
Fallaci put his money down on the counter. ‘*Muchas gracias*,’ he said.
Sliding his legs off the stool, he followed Wilson through the doorway, the sun blinding, flashing off the white walls, the rolling boats, the blue water. Fallaci blinked and squinted around him, at tanned thighs, a string-bikini, then he saw the upraised hand of Mr Wilson, heard the snap of his fingers.
‘Where’s the car?’ Wilson asked.
‘This way,’ Fallaci said.
‘We’re not in public now,’ Wilson said.
‘Sorry, sir. This way, sir.’
They walked along a narrow street, the high walls painted white, the balconies of the apartments overhead casting shadows around them. The street was cool and short, but opened out to a monstrous heat, a dazzling haze that enveloped the parking lot and shimmered over the dusty cars. Fallaci walked on ahead, his leather shoes kicking stones, one hand upraised in agitated motion, flicking sweat from his brow. He stopped at a black limousine, opened the rear door, waited patiently, let Wilson slip inside and settle down before closing the door. When this was done, he glanced about him, a portly figure, no longer suave, then he opened the driver’s door and clambered in and switched on the ignition.
‘How was Paraguay, sir?’
‘It was hot,’ Wilson said. ‘Now please get me there as quickly as possible. I have much work to do.’

Fallaci flushed, feeling reprimanded, released the hand brake, stepped on the gas, and the car moved off smoothly, winding out of the parking lot, eventually turning onto the road to Fuengirola and picking up speed. Wilson sighed and sat back, glanced through the window, saw the traffic, the parched brown-and-ochre hills rolling up to the sky, desecrated by white-walled *urbanizationes*, the influx of foreign wealth. Wilson grimaced with distaste, lowered his gaze, looked straight ahead, saw the dark hair on the back of Fallaci's head, the road racing toward him. Then he smiled and leaned forward, pressed a button in the back of Fallaci's seat, heard a humming as the glass pane slid down and cut him off from his driver.

The rear of the car was soundproofed, air-conditioned, well cushioned, with a drinks cabinet, telephone and Video-TV recording system all built into the back of the front seats. There was a mirror above the cabinet. Wilson studied his own reflection. He saw a deeply tanned, strangely ageless face, blue eyes cold with intelligence. Wilson sighed, feeling removed from all his years, then he unhooked the cassette-recorder microphone and started to talk.

'One. General. The British Mercantile Airship Transportation Company, in collaboration with Plessey, are presently working on an experimental prototype of a Thermo Skyship. The Skyship, which has been developed under the general leadership of Rear Admiral David Kirke, is shaped like a flying saucer with its engines positioned right around the rim. Estimated diameter: six hundred and fifty feet. Approximate weight: five hundred tons. The machine is reputed to get its lift partly from helium and partly from hot air generated by the swivelling jet engines. Envisaged speed at the moment is one hundred miles per hour, but almost certainly this will be improved upon. The British Defence Ministry has expressed interest in this machine with a view to speeding the Rhine Army into battle in any future conflict; and it has been confirmed that the Royal Navy has also expressed interest in the possibility of using the Skyships for North Sea Oil defence… File for review.

'Confirmation received that for the past ten years the United States Air Force has been observing and photographing the secret Soviet laboratory at Semipalitinsk where it is believed the Russians are developing an extremely powerful beam weapon capable of destroying intercontinental missiles at almost the speed of light. The beam is thought to comprise atomic or sub-atomic particles – electrons, protons or ions – equivalent to billions of volts

of electricity and accelerated toward the target at just under one hundred and eighty thousand miles per second. John Allen, senior US government scientist, has stated that a weapon of this type now appears to be possible; and both George J. Keegan, head of USAF Intelligence, and Dr Willard Bennett, member of the US team that was obliged to abandon beam-weapon work in 1972, believe that the Russians are well ahead of the Americans in this field… Regular surveillance of the Semipalitinsk laboratory is recommended.

'In July of 1985 NASA plans to launch a new, solar-powered, ionengine space craft whose purpose is to fly to Halley's Comet and circle Temple 2. A space shuttle will carry the spacecraft into Earth orbit and then a dual-engine Inertial Upper Stage booster will propel the one thousand six hundred kilogram probe into an interplanetary orbit, after which the fuel boosters will drop off and the solar-powered ion engine will take over the three-year, low-thrust voyage to Temple 2… File for review.'

Wilson switched the mike off, pursed his lips, glanced outside, saw the towering apartment blocks sweeping past, the mountains soaring beyond them. This stretch of road was ugly, scarred by hotels and building sites, the original villages now bustling, gaudy towns, filled with tourists and drifters. The old Spain was dead and the new expanded every day, spreading out along the Costa del Sol like a malignant cancer. It was the dawn of Democracy, that old dream that devoured itself, and Wilson, with his ruthless intelligence, was appalled by the sight of it. He a sighed, pursed his lips, heard the humming of the limousine, then sank deeper into his seat and switched the mike on and started talking again.

'Two. Prosthetics. Work is progressing at a dangerous rate on the artificial heart, lung, gut and gill, as well as artificial cells, blood vessels, intestines and even skin. Artificial bones, joints and sockets are being used with increasing success, the main alloys being of the cobalt and chromium variety: tantalum, titanium, niobium and molybdenum. Blood vessels, heart valves, bone, skin, blood and the cornea of the eye have all been preserved artificially. Skin, stored in DSMO for periods of years, has been successfully grafted to the human body by researchers at the University of Pennsylvania School of Medicine. Bone frozen for years and then revived with cobalt radiation has also taken when grafted to the body. Likewise, red blood cells have been freeze-dried for years, and now tissue banks are disturbingly common. Indeed, it has been pointed out that the US Navy

tissue bank recently supplied some three thousand square inches of human skin to Brazilian fire victims… Request further research.
‘External prosthetics. Myoelectric control is advancing every day, with the Soviets reportedly making the greatest advances in this field. Intelligence indicates that the Soviets have already perfected a handarm prosthesis in which all five fingers are capable of closing around objects of variable shape with the precision of a human hand. British scientists have developed, among other items, myoelectric arms with interchangeable hands; while in the United States a team of scientists and engineers from Harvard, MIT and Massachusetts General Hospital have developed a sophisticated myoelectric arm that moves at any angle, speed or force simply by being *thought* into action. This arm picks up muscle signals generated to the natural stump, transmits them to a small amplifier, and uses them to drive a compact electric motor; the machinery for all this is housed inside a flesh-colored, fiber-glass casing that resembles a real arm.
‘Researchers at the Powered Limbs Unit of West Hendon Hospital in England have come up with what amounts to an implantable electrode, or transmitter, called an Emgor. This uses a resonator circuit that does not require batteries to detect myoelectric signals, thus obviating the need for frequent surgical intervention to replenish the power source. It is to be noted that amputees so treated are actually capable of *unconscious* gesticulations – and that similar lower-body prostheses have now been developed to the stage where some surgeons are willing to perform hemicorporectomies: amputation of the entire lower half of the body, including legs, rectum and genitalia. This procedure has already been offered to patients in a prominent New York hospital as an alternative to death by abdominal cancer… Request further research.’
The car turned off the main road, bumping over rough ground, and Wilson looked out to see the surrounding hills, the fields of olive trees and wheat. They passed a scattered *urbanizatione*, the villas whitewashed and gleaming, gardens parched by the sun, the earth hard, a fine dust on the Moorish walls. Wilson studied the place casually, noting the swimming pools and bikinis, the tanned limbs of the expatriates lounging in deck chairs, around low tables. Oblivious. And superfluous. The real world would pass them by. Wilson smiled and settled back, observed Mijas high above, this his blue eyes turned bright and intense when he started to talk again.

‘Three. Gerontology. Dr Richard Hochschild of the Microwave Instrument Company of Del Mar, California, has discovered that adding DMAE to the drinking water of mice increases their life span significantly. Other researchers have successfully employed centrophenoxine to delay lipofuscin buildup in the brain of guinea pigs; likewise, phenoxene is being used experimentally in France to improve the mental abilities of senile patients.

‘Along the same lines, Dr Horace T. Poirier is closed to developing a number of compounds that increase life by as much as fifty percent in mice. These include Vitamin E, mercaptothylemine, BHT, Santoquin and sodium hypophosphite, an old drug used for the treatment of tuberculosis. Also being utilized is DMAE, dimethylaminoethalol, a lysome membrane stabilizer which strengthens cells against damage caused by lipofuscin accumulations… Eliminate Poirier.

‘An increasing number of scientists now believe that the program for ageing is encoded in the hypothalamus-pituitary system. Among these are Dr Joseph R. Wiseman of Chicago, who has successfully reactivated the estrus of aged female rats by stimulating the hypothalamus with electric impulses; he has also reactivated the ovarian cycles of the old females by feeding them L-Dopa, a dopamine stimulator also used in the treatment of Parkinson’s disease, as well as hormones such as progesterone, epinephrine and iproniazid… Eliminate Wiseman.

‘Dr Saul A. Terkel, director of the Gerontology Research Institute, Richmond, Virginia, now believes that if life-extension was to become a national priority like the space program, and if the Americans, Russians and Japanese were to join hands in a billion-dollar assault on aging and death, this could produce dramatic results in five years. Terkel has pointed out that such a program would cost no more than these countries now spend on the maintenance of old-age homes. Now, backed by the full authority of the Gerontology Research Institute, Terkel is lobbying Washington DC with disturbing success… Eliminate Terkel.’

The car climbed the mountain road, bouncing over large stones, passing modern *urbanizationes* and archaic farmhouses, just occasionally passing a Spaniard on a donkey, field hands bent in labor. Wilson frequently glanced out, observing the white haze of the sky, a thin ribbon of grey cloud above the mountains, the dizzying sweep of the valleys. The past was crumbling beneath the present, the future advancing to devour both, and Wilson sat

there, recalling his many years, the broad terrains he had traveled. Then the limousine slowed down, took the left fork in the road, heading away from Mijas, toward Alhaurin el Grande, as Wilson closed his eyes and opened them again and talked into the microphone.

'Four. Telesurgery and telepsychiatry. Telediagnosis is now being utilized between Massachusetts General Hospital and Boston Logan International Airport, between numerous California hospitals, and between two hospitals in Edinburgh, Scotland. Also, a telesurgery linkup has been established between Massachusetts General Hospital and the Bedford Veteran's Administration Hospital eighteen miles away. In all of these areas the computer becomes more predominant.

'It is also to be noted that many bioengineers are now claiming that computer and human brain will soon be directly linked. Said R. M. Page of the US Naval Research Laboratory: "The information which a machine can obtain and store from a person in a few minutes will exceed the fruits of a lifetime of man-to-man communications." As to method: "The coupling mechanisms to carry out the functions will be myriad, including in some cases electrical connections to the body and to the brain. Some connections may be wireless, with imperceptible transmitting elements implanted in the body."

'Further note: Geneticists Harold P. Klinger and Orlando J. Miller, speaking before an international symposium on fetology, suggested that what was needed in the United States was a national registry of hereditary abnormalities to help prevent the conception of defective children. This system would have to be implemented via all newborn children when their skin and blood samples would, as a matter of course, be fed into a computerized genetic scanner which would immediately establish the presence of any chromosomal abnormalities and print them out on data cards that would be kept on permanent file in Washington DC. Computer analysis of current ethical attitudes on this subject is required. Please action.'

Wilson switched off the microphone and gazed through the window to see the mountain village of Coin. The car went through the village, barely noticed by the Spaniards, and traveled on down a steep, winding road, between shadowing rows of olive trees. Wilson leaned toward the console, pressed a button, ejected the cassette tape, dropped the tape into his shirt pocket and then sat back impatiently. The car eventually emerged to

sunlight, to flat fields strewn with rubble, and moved uphill and then leveled out and headed straight for Wilson's house. It was hidden between parched hills, well protected by a high-walled compound, the walls featureless, made of rectangular breeze-blocks that had never been painted. The walls were twenty feet high, their tops covered with barbed wire, the only entrance being a wooden door broad enough for the car. The whole compound was solid, completely hiding the house within, standing four-square between the surrounding hills like some stark, lunar fortress.

The car stopped in front of the compound and Wilson remained in the rear seat while Fallaci walked up to the door. Wilson silently watched him, saw him pressing the buzzer, read his lips when he talked into the box and gave the code word for entrance. Fallaci then returned to the car, slipped inside, waited patiently; then the door moved up on metal grooves and Fallaci drove inside.

'Here we are, sir,' he said.

Wilson sat on impatiently, drumming his fingers on the seat, and Fallaci flushed and hurried out of the car and opened the rear door. Wilson clambered out, stretched himself, looked around him, neither pleased nor disturbed to be back, simply checking the compound.

The compound was empty, graveled earth between walls and house, no flowers, no trees, no outbuildings… just open space to be crossed. There were spy-cameras on all the walls, turning back and forth, high up, their lenses shaded from the sun, equipped with infrared beams for night-time viewing. The house was linear, functional, a rectangle of brick and glass, about a hundred feet long, about fifty feet wide, the roof flat, the structure two stories high, the two front doors made of solid steel. The numerous windows were broad and high, made of bullet-proof, one-way glass. Constantly moving above each of the windows were more scanning devices.

Fallaci approached the front door, glanced at Wilson, pressed a button; the door opened and Wilson entered the building, and Fallaci then followed him. The latter closed the door behind him, pressed another button to reset the alarms, then stood there with his hands behind his back, his full attention on Wilson.

'I'll have a fruit and nut cereal,' Wilson said. 'And a glass of white wine. Very dry. Very cold.'

Fallaci nodded and departed, disappearing through a nearby door, then

Wilson walked along a corridor to his study. The walls were bland and impersonal, covered in spray-on felt fabric, no decoration, just digital control panels filled with flickering green numerals. Wilson studied them on the move, noting temperatures, power levels, then he turned into his study, into silence, subdued lighting, the fiber-glass Jacobean oak panels looking just like the real thing. He sat behind his desk, at a panel of tiered buttons, pressed a button and then sat back in his chair and studied the screens above him.

There were six screens in all, banked in two rows of three, all set into the wall in front of the desk and wired to a scanner. There were scanners all over the building, outside and inside the compound walls, in the bedrooms, in the toilets, in the garage, and they were all wired for sound. Wilson surveyed the whole place from here, controlled its temperature and lighting; he could open and shut doors at wall, plunge the place into darkness.

The screens flickered into life, the pictures monochrome but sharp, showing the kitchen, the servants' quarters, the laboratory, each from a variety of different angles. The spy-cameras moved constantly, showing the whole of each room, and Wilson switched the different receivers on and off, surveying the whole house. For the most part it was empty, the rooms vague in subdued lighting, the walls covered in fibre-glass and spray-on felt, the furniture sparse and functional. The building was almost futuristic, oddly sterile and impersonal, an abode for transient guests, the silence heightening the strangeness.

Wilson switched back to the kitchen, observed Fallaci and the crippled dwarf, both standing in front of a gleaming cooker unit, Fallaci mopping his sweaty brow. The dwarf was a disgusting sight, his spine bent, his legs twisted, his right hand a metal claw a metal claw that was strapped to his arm with wires running into a small pack at his waist. It was a primitive prosthetic and the dwarf was tired of it, forever begging Wilson to fit him with a new one, always being refused. Now Wilson smiled bleakly, reached down to press a button, saw Fallaci and the dwarf look up promptly at the camera above them.

'Hello, Ruediger,' Wilson said to the dwarf. 'How are you feeling these days?'

'Ah, ah,' the dwarf stuttered, his metal claw opening and closing spasmodically, his eyes blinking above a queerly flattened nose and thick, dribbling lips. 'Ah, ah… all right… You know, sir… *all right*… I think… I

mean… *sleepless*.'
'Sleepless? Wilson said. 'You mean nightmares?'
The metal claw waved indecisively, hinges opening and closing, passing over the luminous, frightened eyes to scrape saliva from the dribbling lips.
'Ah… nightmares… Ah, yes, sir… bad, ah… *very* bad… Every night, *all* nights, ah… *nightmares*… Can't *sleep* at night.'
'That doesn't sound good,' Wilson said, still smiling bleakly. 'When did this start?'
The metal claw waved more frantically, the dribbling lips opening and closing, the crippled dwarf in a positive anguish of speaking, trying to force the words out.
'Ah, ah… *start*? When you left, sir… *Always*, sir… always then… When you leave… the fear… dreadful *nightmares*… too frightened to leave here.'
'You should have gone out,' Wilson said. 'I told you: you can leave anytime you wish. I'm sure the break would have helped you.'
'Ah, ah… *grateful*, sir… Tried to go out… but couldn't do it… Too frightened… *very* frightened… of what's out there… Too many bad dreams.' The claw opened and closed, steel fingers snapping at air, the dwarf's head rolling helplessly on stooped shoulders, lips dribbling constantly. 'So glad you're back, sir… So relieved… *Please*, sir… want you… *help me*!'
'Go to your room,' Wilson said soothingly. 'Close your eyes. Try to sleep.'
'Please, sir… Please, no… The *nightmares*!'
'No more nightmares,' Wilson said soothingly. 'I am back. No more bad dreams.'
The dwarf trembled with emotion, waved his claw, muttered his gratitude, then turning away, glancing nervously at Fallaci, he shuffled out of the kitchen. Fallaci remained where he was, still looking up at the camera, a sharp image on the montor screen above Wilson's blue eyes.
'He's been orderly?' Wilson asked.
'Yes, sir, he's been fine. I tried to force him out once or twice, but he was too scared to go. It worked just like you said it would.'
'Good,' Wilson said. 'I'll have my meal in ten minutes. I'll relax for half an hour after that. You can send the girl up then.'
'Yes, sir,' Fallaci said.
Wilson pressed another button, putting the monitors on automatic, then he withdrew the cassette tape from his shirt pocket and slotted it into the

console. When the recorder turned itself on, Wilson started to talk again.
‘Five. Brain research. Electrical stimulation of the brain, ESB, has recently become dangerously innovative. The suggestion that computer-controlled electrodes be implanted in the brains of babies a few months after birth, thus robotizing them for life, has already been made by Curtiss R. Schafer in a paper he presented to the National Electronics Conference in Chicago some time ago – and while such a suggestion may have been made half in jest, it is now clear that such devices have moved out of the realms of animal experimentation and into the human arena with volunteer subjects wired for electro-sleep, electro-prostheses, electro-vision, electro-analgesia, electro-anaesthesia and, increasingly, electro-sociology.
‘Dr Jose M. R. Delgado, professor of physiology at the Yale University School of Medicine, and Dr James Olds of McGill University in Canada, have both experimented with the so-called pleasure centers of the human brain, as has Dr Robert G. Heath of Tulane University. Meanwhile, Dr C. Norman Shealy, chief of neurosurgery at the Gundersen Clinic in La Crosse, Wisconsin, has perfected electro-analgesic techniques to the stage where they are now being applied to humans, mainly through the implanting of a pointeight to one-point-two stimulating electrode in the spine, rather than in the brain. Regarding electro-sociology, a team of doctors at Massachusetts General Hospital and Boston General Hospital have pacified violent human subjects by the implantation of electrodes into the rostral part of the caudate nucleus of the brain. It is requested that all these people be placed under immediate surveillance.’
Wilson switched the recorder off and sat back looking thoughtful, then he stood up and crossed the room to place his hand over a control box. The opaque box glowed red and the paneled walls slid apart to reveal a linked audio-visual computer system, a mass of monitor screens and controls. Wilson pressed the MODE button, another button marked VISUAL/RECORD, and a monitor screen, six feet by six, crackled into life. Wilson then turned a directional knob and saw a door, a white wall; he kept turning until he saw the crippled dwarf stretched out on his bed. The dwarf was still fully clothed, a pair of blue denims, a checkered shirt, and he twisted and turned uncomfortably on the bed, moaning loudly and sweating. His eyes were luminous with fear, his metal claw opening and closing spasmodically, and when he glanced around the room he seemed to shrink from the blank, white-painted walls.

‘Stay still,’ Wilson said, speaking softly. ‘Relax. Just lie quietly.’
The dwarf froze where he lay, his large eyes fixed on the camera, as Wilson turned another knob marked ZOOM to see the dwarf’s face in close-up. The dwarf’s eyes were now filled with hope, beads of sweat shone on his nose, and his tongue crept out tentatively from his lips to lick up the saliva.
Wilson studied the screen and smiled, flicked a switch, turned a knob, and the dwarf’s head started jerking, the eyes widening, then closing, until his head seemed to sink into the pillow, the lips shaped in a crooked smile.
Wilson studied the large screen, observed the dwarf in sleep, turned the sound up and heard even breathing, a heart beating now beating normally. He then looked at the ECG, noted the subdued, irregular flickering, and satisfied that the dwarf would sleep well, he turned the monitor off.
Moving away from the console, Wilson crossed the study and went through a doorway, into an adjoining, L-shaped lounge. Covering one wall of this room was an enormous ITT television set, a Neal taperecorder, a Philips video-recorder, and a bank of expensive Revox hi-fi equipment. Facing this luxurious system, about fifteen feet from it, was a low settee with a bank of switches on one arm. Wilson sat down here, found a list of video programs, studied them and then pressed the switch that was wired to the kitchen.
There was a soft humming sound and part of the paneled ceiling descended, dropping down until it covered Wilson’s legs and formed a small table. Resting on the table was a bowl of fruit and nut cereal, with a glass of white wine. Very dry. Very cold.
Wilson pressed another switch marked VIDEO/PLAY/3, then he picked up his spoon and started eating as the TV screen brightened. He watched the program as he ate, his blue gaze intense, occasionally rubbing his unusually smooth, unlined forehead, concentrating ferociously. It was a pre-recorded tape, a compilation of various programs, a condensed survey of all the scientific and political events that he had missed during his absence. He finished his meal, but kept watching, his brain recording, calculating, and only when the program had ended did he appear to relax. He pressed another button, the table ascended into the ceiling, and then he stood up and languidly stretched himself and went into his bedroom.
This room was like all the others, the lighting subdued, the temperature moderate, a few expressionist paintings on the walls, more control panels flickering. Wilson undressed himself, his body lean but tense with muscle, lengthy scars running across his back and chest, and stepped into the

shower. Like all else in this building, the water's temperature was preset; the water also contained an olive-based detergent that negated the need for soap. Wilson stood there for some time, his brain disseminating information, then he stepped out, dried himself with a warmed towel, and then stretched out on the bed.

There were glass panels in the ceiling, hiding a Nordic solarium; when Wilson pressed another button, the glass panels slide apart and the solarium came on automatically, beaming down infrared rays. Wilson lay very still, his eyes covered by protective glasses, breathing deeply, holding his breath for long periods, letting it out only slowly. His tense muscles relaxed, his scarred body seemed to glow, and then, precisely thirty minutes later, the solarium switched itself off.

The girl arrived shortly after, opening the door with some care, looking at him and seeing him nod and padding quietly toward him. She was in her bare feet, her body wrapped in a loose sarong, her jetblack hair trailing down her spine, shining under the soft lights. Wilson remained on the bed, completely naked, looking up at her, his azure gaze revealing no more than a cool curiosity. The girl was slim, very young, probably in her late teens, her brown eyes and copper-toned skin suggesting a half-caste Eurasian. She stood beside Wilson's bed, her head bowed, her hands clasped, and Wilson remained there, studying her at length, quietly pleased by her beauty.

'What's your name?' he finally said.

'Rita,' the girl whispered.

'You know what I require?'

'Yes, sir.'

'Good. Please proceed.'

The girl loosened her sarong, let it fall to the floor, and stood there, her naked body gleaming, covered lightly with oil. Her legs were long and slim, her waist tiny, her breasts full, the triangle of hair slightly shaved, quite smooth, almost velvety. Wilson looked her up and down, his gaze calm, analytical, then he nodded and the girl smiled with gratitude and sank to her knees.

She leaned over the bed, her hair falling across his loins, then she held his flaccid penis in one hand and slid it into her mouth. He watched her, smiling thinly, feeling her lips, her rolling tongue, her teeth pinching gently, imperceptibly, her mouth wet, a warm glove. Wilson lay there and smiled, a remote smile, half regretful, then he reached out and touched the girl's head,

felt it move up and down. Her wet lips, her rolling tongue; he tried to feel her and respond, gazing down at her shining, outspread hair, trying to will himself into her. The girl was expert, well schooled, her mouth working its ways on him, but the distance he had traveled, all the years, again rendered him impotent. The girl eventually raised her head, his flaccid penis in her hand, her brown eyes enlarging, lit by fear, her face begging forgiveness.
'It's all right,' Wilson said quietly. 'It's not your fault. Just use the machine.'
The girl was visibly relieved, standing upright, smiling gratefully, then she went to the wall beside the bed and pressed an imbedded button. Two paneled doors slid apart, exposing a walk-in cupboard, and the naked girl entered and then emerged with a small, mobile console. Wilson closed his eyes again, heard her movements, felt her hands; she dabbed the paste on his forehead, on his cranium and temples, then she fixed the thin electrodes to his skull and switched on the machine.
An imperceptible current. A flow of energy through his brain. He relaxed, gave himself to the machine and felt his body responding. Opening his eyes, he saw himself: his erect, engorged penis; the naked girl leaning over his penis, tying something around it. He closed his eyes and surrendered, the years falling away from him, voluptuous visions and perverse, buried fantasies rising up to envelop him. Fierce reality and heat; the sublime, unraveled flesh… he saw it and touched it and felt it and returned to his youth. The girl breathed in his face, her tongue slipping between his lips; she moved down him, down his body, her lips and tongue busily working at him, sliding over him, burning him. The visions filled him and released him, engorged his penis and drained it, and then he gasped and slowly opened his eyes and felt the inflowing peace.
The room seemed a lot brighter. The naked girl was very real. He watched her as she soaped his sperm-drenched loins, washed him clean, dried him carefully. When she had finished, she straightened up, her dark, oil-slicked body gleaming, looking at him, at once nervous and questioning, her head bowed automatically. Wilson smiled at her and nodded, indicating that she could leave, so she pushed the console back into the cupboard, closed the doors and left the room.
Wilson put on his dark glasses, pressed a button and then stretched out; the glass panels in the ceiling slid apart to expose the solarium. Wilson lay there for some time, trying to relax, his eyes closed, but eventually his

restless intellect forced him upright and made him start work again. He rolled off the bed, put on his dressing gown, then entered the study and sat down and turned on the tape-recorder. He spoke quietly, precisely, academically.

'Dr George D. Schroeder of the American Institute of Orgonomy, Seattle, writing in the English magazine, *New Scientist*, has stated that orgone energy weather engineering techniques are an important new element in the environmental struggle. Schroeder has finally received government backing for a lengthy program of investigations into weather engineering possibilities. Already he has discovered that orgone energy exists as a mass-free energy in the soil, water and atmosphere of Earth, and that it is manipulable by mechanical cloudbusters, more commonly called CLBs. It is to be noted that so-called *tuned* CLBs have proved their value not only in weather engineering, but in more than one UFO investigation. This has to be stopped.'

Wilson stopped talking, sat back, stroked his chin, his silvery-grey hair falling over his blue eyes, across that smooth, unlined forehead. He gazed at the opposite wall, at the banked monitors and videorecorders, and his bright, mathematical brain considered all of the options. He had once met Schroeder, had found him tough and intelligent, a possibility that might yet be tapped, a candidate for the future. It was a pity of lose Schroeder, but he didn't have much choice: the good professor now had government backing and that smacked of progress. Wilson gazed across the room, pursed his lips, stroked his chin, then he sighed and ran his fingers through his hair and spoke quietly, implacably.

'Eliminate Schroeder.'

Chapter Three

The Audi 100 GL, all white and polished and gleaming, came up over the top of the hill and rolled down through the narrow, gray street in no particular hurry. Richard stepped forward quickly, his thumb high in the air, but the gleaming white Audi purred past, splashing water across him.

'Oh, shit,' Richard murmured.

He lowered his thumb and wiped rain from his forehead, glancing up to see the leaden gray sky and the dark, drifting clouds. At least the rain had stopped; there was that, if nothing else. Richard shivered, adjusted his knapsack, checked the camera strap around his neck, then, soaked to the bone, his hair samply plastered to his head, he turned and walked along the village street, past a row of semi-terraced houses.

The road opened out at the end of the village, curving uphill past a seventeenth-century church, dominated by green hills. The Audi had stopped in front of the church, its engine cutting in and out, the car jerking roughly as it misfired and tapered off into silence.

‘Good for you,’ Richard murmured.

He wiped rain from his beard, adjusted the knapsack again, then sauntered in a deliberately casual manner toward the stalled car. An arm emerged from the driver’s window, suntanned, definitely feminine, the fingers fanning out to drop a cigaret in front of Richard’s feet.

‘Jesus!’ the woman softly exclaimed.

Richard stopped immediately, looked down, saw her green eyes, a wave of shining red hair tumbling around pouting lips. The women clenched her right fist and lightly hammered the steering wheel, then licked her upper lip and glanced at Richard, her fine eyebrows raised. Richard smiled encouragingly at her, ran his fingers through his long hair, his blue denims and jacket still wet, the cold creeping into him.

‘Can I help?’ he asked.

The woman studied him for a moment, gently biting her lower lip, then, satisfied that he looked sane, she shrugged her shoulders and nodded.

‘I haven’t a clue what happened,’ she said. ‘It just suddenly cut out.’
Richard shivered and glanced about him, saw the green hills of Devon, then he let the knapsack slide from his shoulders and fall to the ground.
‘It might be nothing,’ he said. ‘A bit of damp. Something jammed. It probably isn’t anything serious. I’ll look under the hood.’

The woman stared thoughtfully at him. Her gaze appeared to be unfocused. She had a thin, suntanned face, sophisticated, rather weary, fine eyebrows arching above the green eyes, lips unpainted and moist.
'Get it started and I'll give you a lift,' she said. 'Cars quite simply baffle me.'
'It didn't cut out gradually?'
'No,' the woman said. 'I saw the lightning and then the engine cut out. Does that make any sense to you?'
Richard glanced at the gray sky. 'Lightning?' he said. 'Are you sure? *I* didn't see any lightning. I don't think it was that.'
The woman shrugged again. 'It *looked* like lightning. Anyway, that's when the car cut out. I just don't understand it.'
'Not lightning,' Richard said. 'There was definitely no lightning. You probably saw the lights of a plane. Let me look at the engine.'
The woman shrugged a third time, then leaned across to her left, her hand reaching down to the floor. Richard shivered, feeling cold, hearing the snapping of the lock, then he walked to the front of the car and raised the wide, heavy hood. The engine appeared to be normal. He told the woman to try the ignition. When she did so, the car roared back into life and then ticked over smoothly.
Richard stepped back, surprised. He glanced past the raised hood. The woman was leaning out of the window, the wind blowing her red hair.
'What did you do?' she asked.
'Nothing,' Richard confessed.
'You must have done *something*,' the woman said.
'I just looked at it,' Richard said. He threw her a grin, slammed the hood down, then walked back and leaned toward the woman, his gaze fixed on the warning lights on the dashboard.
'It looks okay,' he said. 'The battery light's out. It must have been something pretty simple and it's obviously cured itself.'
The woman smiled at him, her green eyes unfocused. 'You just looked at it and it worked,' she said. 'You must be a charmer.'
Richard blushed and grinned shyly. 'I don't think so,' he said. 'Anyway, it's working again, so do I get that lift now?'
'Where are you headed?'
'St. Ives.'
'You've got it,' she said. 'Put your knapsack in the boot. It's not locked.

Let's go while the going's good.'
Richard grinned with pleasure, a boyish grin, blue eyes brightening, then he picked up his knapsack, glanced briefly at the nearby church, and walked to the rear of the car, glad that it had stalled. He opened the trunk, heaved the knapsack in, closed the lid and then returned to the woman, looking down at her upturned face. She had lit another cigaret, her lips pouting, blowing smoke, and the green of her eyes was slightly bloodshot, her gaze still unfocused.
'Okay,' she said. 'Get in.'
'Front or rear?' Richard asked.
'I don't like to talk over my shoulder, so get in beside me.'
Richard walked around the car, opened the door and slipped in, closed the door and sank into his seat, appreciating the luxury. The dashboard was polished wood, the seats a deep maroon velours, and the woman, in her knee-length dark dress, seemed to match it all perfectly. Her red hair was long and lustrous, tumbling down to her shoulders, emphasizing the shifting green of her eyes when she glanced briefly at him. She put her foot on the clutch, the dress tightening, drawing upward, and Richard glimpsed the shadowed outline of her thighs as she turned the ignition on.
'It's still working,' she said.
Richard nodded his agreement, clasped his hands and unclasped them, as the woman pressed down on the accelerator and the car started moving. The sodden, green hills, the dripping trees, the brooding clouds above the unwinding road… Richard kept his gaze fixed on the scenery, feeling tired and unreal.
The woman drove in a careless manner, averaging fifty miles an hour, her right hand manipulating the steering wheel, her left holding the cigaret, the lips pouting when she exhaled the smoke, her breasts rising and falling. Richard kept glancing sideways, attracted to her, feeling furtive, surprised that he could harbour such notions for a woman so old. Well, not really so old: probably in her late thirties. Nevertheless, she was sexy, her legs long, her breasts firm, and Richard flushed when she suddenly stared at him with her slightly bloodshot, unfocused, cat-like green eyes.
'What's your name?' she asked.
'Richard… Richard Watson.'
'A student?'
'Yes,' Richard said. 'I go to the Art College in Hornsey. I want to be a

designer.'
'Hornsey?'
'London.'
'Ah, yes,' the woman said. 'North London. I'm not keen on that area.'
She drove in silence for another minute, breathing deeply, exhaling smoke, and Richard shifted uneasily in his seat, trying to keep his eyes off her.
'A designer,' she said eventually. 'What kind of designer?'
'Magazines,' Richard said. 'That kind of thing. At least that's what I'd like to start with.'
The woman looked at him and smiled, blinked her eyes, coughed a little. Richard glanced down to see her silken legs tapering into the high-heeled shoes.
'Why are you going to St. Ives?' she asked.
'Just a holiday,' Richard said. 'A friend of mine owns a holiday cottage and he's letting me use it.'
The woman smiled again, lips pouting, blowing smoke; the smoke swam in a haze around Richard, making him cough.
'An art student,' the woman said.
'That's right,' Richard said.
'All art students drink,' the woman said. 'At least that's what I've heard.'
She put her cigaret in her mouth, inhaled, blew the smoke out, held the steering whee lightly in her free hand, the wet hills whipping past her.
'Well?' she asked abruptly.
'What?' Richard responded.
'Is it true that most art students drink?'
'I wouldn't know,' Richard said.
He coughed into his fist, slightly embarrassed by the drift of her conversation, and tried not to look at the breasts thrusting out from her tight dress. The woman was obviously well off, a bit jaded, worldly wise, but her strange, oblique statements filled him with a sense of foreboding. Thinking that she might be drunk, he glanced at her bloodshot eyes. Though she looked drawn and certainly tired, he still thought her sexy.
Richard shifted uneasily. A guilty flush burned his cheeks. He thought of Jenny back in London, of the two weeks ahead of him, and he silently cursed his primitive lust and wondered how men survived it.
'Do *you* drink?' the woman asked.
'When I can afford it,' Richard said.

‘Good,’ the woman said. ‘I’d rather not drink alone. You’ll find a flask of gin in the glove compartment. I think we should share it. Shake off the cold at least.’
Richard turned his head slightly, glanced at her, saw her eyes, twin pools of green flecked with red, and was convinced of her drunkenness. He turned away just as quickly, desiring her, feeling foolish, pulled the lid of the glove compartment down and found two hip flasks, one on top of the other.
‘The bottom flask,’ the woman said. ‘The one on top is empty. I get tired when I drive.’
Taking note of that odd remark, Richard removed the top flask, withdrew the one beneath it, unscrewed the cap and held the flask out to the women. She shook her head from side to side, her red hair like a flame.
‘You first,’ she said quietly.
Richard shrugged and drank some gin, felt it burning down inside him, warming him, making his head swim, alleviating his weariness. He wiped his lips and burped a little, passed the flask to the woman; she stubbed her cigaret out, took the flask, her other hand still on the steering wheel.
Richard watched her drinking. The shining red hair framed her face. When she finished, she gave the flask back to him and placed her free hand on the steering wheel.
‘Have another,’ she said.
They both drank too quickly, passing the flask back and forth. The A30 ran past Dartmoor, through Featherford and Fowley, stretched ahead through the sodden hills and fields, climbing languidly and rolling downhill again. They saw little of all this, both involved in their drinking, time dissolving as the drink took command and made them feel even more unreal. Richard studied the woman. He thought of Jenny back in London. This thought, with its residue of guilt, crossed his mind and then passed on.
‘You didn’t see the lightning,’ the woman said obliquely. ‘I just don’t understand that.’
Richard reached into his pocket, withdrew a cigaret, lit it and then glanced at the woman, wondering what she was talking about. The woman returned his gaze, her green eyes bloodshot and unfocused, while the car, offering a smooth, rhythmic humming, rolled on through the desolate countryside.
‘Where are you going?’ Richard asked.
‘To Bodmin,’ the woman said. ‘I live in St. Nicholas. It’s a very small place, very quiet… Without London, I’d die.’

Richard didn't reply. The woman seemed even more distracted. Richard scratched his forehead and glanced out the window and noted that the drifting clouds were thinning. A pearly gray haze broke through, striations of weak light beaming down, fanning out, fanning over the wet fields and the stark, Neolithic remains.
'What time is it?' the woman asked.
Richard checked his wristwatch. 'Ten to six,' he said. 'Around that… give or take a few minutes.'
'You didn't see it,' the woman said.
'The lightning?'
'The light. It was obviously some kind of bright light. I keep thinking about it.'
Richard shivered, feeling cold again. 'There was no lightning,' he insisted. 'No thunder, no lightning – just the rain. You must have seen an airplane.'
'With lights?'
'With lights.'
'In the daylight?'
'That's right.' Richard drank some more gin and passed the flask to the woman. He saw the scepticism in her eyes and looked back at the onrushing road. 'Okay,' he said. 'So you saw a bright light. You saw a flash – a plane reflecting the sunlight. I think that's what it was.'
He sighed – too loudly. The woman's gaze turned toward him. She shrugged and put the flask to her lips while driving dangerously fast.
'No,' she said. 'It was too quick for that. It just appeared in a flash and then disappeared.'
Richard shook his head wearily, feeling drunk, slightly disturbed, staring out at the cold, descending evening, at the vast, bloody sky. The sun was sinking beyond the moors, a fiery orb, large and luminous, melting slowly, spreading out along the low hills in two streams of pulsating flame.
'Not possible,' Richard murmured. 'Just not possible. You must have imagined it.'
The woman didn't reply. Her red hair reached her breasts. The car hummed and vibrated, an abstract, seductive rhythm, the bleak hills of the moors rolling past, the road unwinding in front of them. Richard looked and was held, saw the marshlands and quarries, the Neolithic stones silhouetted in that fierce, bloody sky. It was the landscape of a dream, serenely beautiful, yet ominous, and it made Richard shiver and lower his gaze, wondering

why it disturbed him.
‘I think I’m drunk,’ he murmured.
‘Already?’
‘Yes.’
‘You must have been tired,’ the woman said. ‘Lie back… Try to sleep.’
Richard stubbed his cigaret out, put his head back on the seat, closed his eyes and felt the drowsiness creep over him, almost embalming him. His thoughts scattered and spun, became streaming stars, dark shapes, the past and present in one, as a shifting kaleidoscope: the cluttered rooms of the art college, a nude model in a chair, Jenny’s brown eyes, the woman’s flaming hair, the swirling mist over shadowed hills. He fell in and out of sleep, felt a langorous desire, saw the tight dress on the woman’s shapely thighs, Jenny’s steady, accusing gaze. Guilt and lust made him restless. His eyes fluttered and opened. He felt the woman’s fingers at his elbow, tugging sharply, incessantly.
‘There it is!’ she said. ‘*Look*!’
Richard shook himself awake. The car vibrated beneath him. He glanced briefly at the woman, saw her green eyes, the red hair, glimpsed the pink bud of her tongue between her teeth and then looked at the sky. The sun was sinking in the west, a crimson orb above the hills, the sky a molten stream of red and blue, the clouds drifting away from him. Richard looked all around him. He saw nothing unusual. He looked back at the woman, saw her bloodshot, glinting eyes, and wondered just how much she had drank before picking him up.
‘There’s *what*?’ he said.
The woman whispered something, shook her head and smacked the steering wheel. ‘Damn it,’ she said, ‘it was there. I just saw it! *That light*!’
Richard rolled his eyes mockingly. ‘The lightning?’ he said.
‘No!’ she snapped. ‘Not lightning. Something else. A streak of light. It just passed us.’
‘Passed us?’
‘It crossed our path. It flew east to west. A long streak of light. Like a tadpole. I just blinked and it disappeared.’
‘A meteor,’ Richard suggested.
‘You think so?’
‘I think so.’
‘Maybe you’re right,’ the woman said. ‘I don’t know… It seemed strange.’

She shook her head from side to side, her eyes brighter, less bloodshot, flitting from left to right in nervous spasms, surveying the twilight sky. Richard stared at her, disturbed, wondering if she was hallucinating, now aware that she had really drank a lot and was dangerously tired. Then he looked up at the sky. He did it almost against his will. He saw drifting gray clouds, the crimson fire of the sinking sun, vaporous ribbons of mist along the hills, the lonely splendour of Bodmin Moor.

'We're in Cornwall,' he said.

'You're a bright boy,' the woman said. 'We've been in Cornwall for the past thirty minutes and you've finally noticed.'

Richard flushed at her sarcasm. 'I'm pretty sleepy,' he said. 'I'm tired and the gin just knocked me out. I can hardly keep my eyes open.'

The woman appeared not to have heard him. She kept looking all around her. Her green eyes were too bright, framed by flaming red hair, and she kept licking nervously at her upper lip, her tanned brow furrowed anxiously. Her tension was contagious, reaching out to touch Richard; he glanced around and saw the moors, the hills rushing past the car, rising and falling away into shadow, looking ancient and frightening. Richard shivered again. He suddenly felt oddly haunted. He stared obliquely at the sun, at that sinking ball of fire, and the light spread out and filled his line of vision and made his eyes sparkle.

'Why strange?' he asked.

'Pardon?'

'You said that the light you saw seemed strange. What did you mean by that?'

The woman's eyes turned toward him, too bright, no longer bloodshot, took him in and then turned back to the road and blinked repeatedly, nervously.

'I don't know,' she said.

'Think,' Richard said. 'Let's assume it wasn't a meteor or a plane. What do you *think* you saw?'

The woman took a deep breath, nervously licked her upper lip, then raised her left hand, spread her fingers and patted her hair.

'It was very fast,' she said. 'It was very close the first time. The first time I just saw a bright flash and I assumed it was lightning. The next time it was different: it was farther away. It was fast – a lot faster than a plane – and it seemed unnaturally bright. It flew from east to west. It shot across and disappeared. And it didn't really fly out of sight: it just seemed to blink out.

It wasn't a plane. I know it couldn't have been a plane. It was strange. It wasn't a meteor. It appeared to be… *climbing*.'

Richard felt ill. His head was light and he felt feverish. He wiped his lips with the back of his hand, glancing vaguely around him.
'*Climbing*?' he said.
'You're always repeating what I say.'
'It was faster than a plane and it was climbing? Are you sure you saw right?'
'I'm not *that* drunk,' the woman said. 'I think I know what I saw. That light was very bright, very fast, and the damned thing was… *ascending*.'
'Any noise?' Richard asked.
'Not a sound,' the woman said. 'It just shot across the sky, in front of the car, and then it blinked out… making no sound at all.'
Richard glanced around him, saw the desolate, timeless moors, sludge-like clouds drifting over the misty hills, the sky a darkening crimson haze. There was nothing up there. The woman was probably hallucinating. She was obviously very tired, she'd had too much to drink, and now she was starting to fall apart and see things that weren't there.
This thought disturbed Richard. He wanted to get out of the car. He didn't want to end up in a ditch with his head through the windscreen. Hoping to avoid the subject, he closed his eyes and tried to sleep. He slipped in and out of consciousness, his head spinning, stomach churning; he thought of Jenny back in London, of the cottage in St. Ives, of the woman's red hair and green eyes, her tongue licking her upper lip. These visions were relentless, materializing and disappearing, giving way to streaming stars and spinning suns, to white lights in a black void. Richard shivered and muttered incoherently. A bolt of panic lanced through him. He almost groaned aloud, but checked himself, shook his head and licked his dry lips, then spiraled back up through the darkness and opened his eyes again.
'What on earth…?'
The woman glanced at him, shook her head in bewilderment, pressed her foot on the accelerator and changed gears as the car coughed and spluttered. The engine roared and then cut out. The woman cursed and pumped the pedal. The engine spluttered again and then was silent as the car rolled downhill. The woman turned the ignition key, changed gears, but nothing happened. The car rolled down the hill, its wheels hissing in the silence,

then it stopped where the road leveled out and its headlights blinked off.
'I don't believe this. *What's wrong*?'
The woman shook her head and angrily smacked the steering wheel. She turned the ignition key a few more times and still nothing happened. Cursing, she looked at Richard. He shrugged and stared outside. He saw the blood-red sky, the gnarled, silhouetted trees, a nearby circle of Neolithic stones that made him think of other worlds. Richard felt himself shivering. The silence seemed to be vibrating. He gulped and licked his lips, his heart racing inexplicably, then he turned and stared hard at the woman and imagined a roaring.
Not a roaring… Something else… A strange, nerve-tingling humming. Richard blinked and saw that huge pulsating sun, the light shifting, expanding. 'Oh, my God!' Richard whispered. He abruptly forgot what he was doing. The sun expanded and became a white sheet that blotted out the whole sky. Richard gasped and knew fear. He pushed the woman against her door. He saw her hands darting up to cover her ears, the sky beyond her a silvery haze.
'*Jesus Christ*!' Richard hissed.
It came over the nearest hill, over the Neolithic stones, a fierce, incorporeal luminescence that spread out and moved forward. Richard stared and was blinded, turned away and looked again, heard a loud, almost physical humming, felt the sound, was crushed by it. The woman shrieked and shook her head, her hair falling around her face, bent forward, huddled up, her head touching her knees, trying to hide in her seat. The noise increased and the light expanded, swept across them, filled the car, and Richard gasped and felt a sudden scorching heat that made him howl and double over, just like the woman.
His head touched the woman's head. The whole car started shaking. The engine roared into life and then cut out again and left only the sound of the woman's sobbing. Richard retched. He felt the burning of his face. He touched the woman and felt her jerk away as if stung by a whip. The vibration, the noise… Oh, my God, it was cutting through him… His body trembled as his mind slipped into chaos, an intense, choking fear… What was it? Jesus Christ! Something roared and shook the car. He glanced up and saw the woman's red hair, the blinding white light beyond her. Richard felt his heart pounding. Sweat was pouring down his face. The car rocked from side to side, shrieked in protest, and then settled down again. Leaving

silence… and fear.
Richard shivered and shook, reached out slowly, touched the woman; she recoiled and stared at him with wide eyes, still crouched low on the seat. They just stared at one another. Neither knew what to say. The interior of the car was unnaturally bright and then it abruptly darkened. Richard wiped sweat from his forehead, licked his lips, gasped for air, his chest heaving, lungs scorched and sucked dry, arms and legs shaking helplessly. The woman's green eyes were glazed, looking at him and through him; and then, as if by order, as if reading each other's thoughts, they both sat up and turned to the front and looked out at that brilliant white haze.
'*Oh, my God*!'
'*Jesus Christ*!'
The fear crawled up Richard's spine, took a hold, shook him viciously, left him limp and drained, a hollow shell, almost mindless with disbelief. The woman clearly felt the same, body twitching, dress soaked, her hands rising blindly to her face, fingers outspread and trembling. They both sat there in the car, looking out, their eyes stinging, taking in the impossible dream, their senses deserting them.
The white haze was receding. Beyond the white haze: a dark mass. The dark mass, that great featureless body, was blocking off the whole sky. Richard stared and was mesmerized, terrified and fascinated, looking out across that field of shimmering light to where it eclipsed the sinking sun. He couldn't believe in that dark mass. He kept looking and it remained. The white haze seemed to flare up and fade slightly, and then he saw the dark mass more clearly.
It was hovering above the ground, about a hundred feet up, an enormous dark mass, a dark mass containing lights, sequential flashes of green, blue and orange, very bright, very fast. The lights went from left to right, illuminating the ground below. Richard gasped when he saw an immense, silvery disk stretching over the whole field. It was several stories tall, about three hundred feet in diameter, an enormous, kaleidoscopic apparition that rendered him speechless.
Fear and fascination. Disbelief and stunned awareness. Richard felt his thoughts slipping and sliding into dark, swirling chaos. Was he drunk? Hallucinating? The woman's red hair: Was she real? He gasped for air and tried to stop himself from shaking, tried to keep himself sane. The woman trembled beside him, her hair falling upon her shoulders; her spine was

arched and she seemed to shake in spasms and then settle down again. Richard looked past her head, saw that huge, floating mass, its colored lights flashing on and off brilliantly, illuminating the field below.
Richard sobbed and bit his lip. He looked again and saw it changing. It flared up and went dark, became one with the evening sky, then two panels of yellow light, a good three hundred feet apart, materialized to silhouette two black pupils, two bright eyes staring down at him. The woman gasped and bit her knuckles. Richard held on to his seat. The shimmering panels disappeared, the black pupils became metallic, then they flew down from that vast ink-colored mass and headed straight for the car.
'*Jesus, no!*' Richard whispered.
A whipping sound: the car shook. A brief silence: a sudden humming. Richard closed his eyes and opened them again and saw the disks at both sides of the car. They were miniature flying saucers, about three feet in diameter, and they circled the car slowly, first humming, then whistling softly, and then a beam of light shone from each one, cutting down through the darkness.
The car began to shake. Richard groaned and clenched his fists. He glanced at the woman, saw her sitting up straight, and understood, rather than saw, her paralyzed fascination. Richard couldn't believe it; he sensed no fear in her at all. Then a disk dropped by her window, shone a bright light on her face, and she gasped, visibly twitched, settled down, closed her eyes and just sat there. Richard sank into his seat. The blade of light burned his neck. It moved away and he sat up again and saw the disks disappearing.
'It's all right,' the woman whispered, opening her eyes, looking peculiar. 'Don't be frightened. It's all right.'
Richard stared at her and shivered, disbelieving, wracked by fear, his breath coming in large, anguished gulps, his heart pounding, his head on fire. Against his will, he looked up. The panels of light blazed in the sky. He saw the immense, much darker mass above the field, the panels of light at each end of it. Then the panels swallowed the disks, blinked out, leaving darkness; then the black mass, that enormous floating shape, started glowing and flashing.
Mesmerized, Richard watched it.
The great disk was solid, a silvery craft in a shimmering white haze, towering high and spread out across the field, flashing green, blue and orange lights. It now had shape and dimension. It had long, narrow

windows. Silhouettes moved back and forth across the windows, very small, faraway. The colored lights continued flashing, illuminating the field below; the tall grass and shrubs had been flattened and appeared to be scorched. Richard looked up in awe. He saw the panels at either end. They were doors and they opened again, looking larger, more ominous. Then Richard shook with fear. He reached out to touch the woman. He saw another two disks, silverygray, emerging from the panels. There were searchlights on these disks, turning down toward the car. The disks hovered just in front of the larger craft, then flew toward Richard.

'*Oh, God*!' he whispered, distraught, feeling unreal, disorientated, stripped of every defence; he sat trembling in his seat, feeling naked, dispossessed from the real world. What was happening? Was this real? Where was he? *Hallucinating*! He tried to think about who he was, what he was, but then it all fell away from him. A whipping sound, a sudden wind, the car shaking and shrieking, then silence, the other disks at each side of him, their gray metal gleaming.

Richard almost stopped breathing. He couldn't believe what he was seeing. He reached out and grabbed the woman by the shoulder and she turned and stared at him. He saw her suntanned face, the red hair, the moist lips; her green eyes were staring at him and through him as if he didn't exist.

Richard shivered and turned away. He saw a disk outside the car. It was about thirty-five feet wide, hovering just above the ground, and its perimeter swept up to form a dome made of something like frosted glass.

Richard stared, mesmerized. A strange creature stared back. The opaque dome distorted its features, made it look quite grotesque. The eyes were two slits, the nose appeared to be metallic, and Richard shivered with revulsion when he realised that it didn't have lips. The creature's skin was gray and wrinkled. It raised a clawlike hand. Richard screamed and then a beam of light struck him and rendered him oblivious.

Darkness. Streaming light. A sudden nausea and dread. Richard retched and shook his head and sat up and hardly noticed the woman. No point looking: she was frozen. Richard stared straight ahead. He blinked and began to scream and then stopped himself and just shrank in his terror.

He was still in the car. The fallen night stretched around him. The mother ship, that enormous craft, was coming down and blocking out the whole view. It seemed incredible, almost magical – its very silence made it awesome. It was spread across the field straight ahead, its colored lights

flashing on and off. Richard licked his lips and groaned, rubbed his eyes and shook his head. The enormous craft settled down above the ground, fifty yards from the car.
Then the car started moving. It also went wild. Richard's camerastrap snapped, the camera smashed against the dashboard, then his ballpoint pen shot out of his pocket and fixed itself to the windscreen. Richard couldn't believe it. The air was sucked from his lungs. The woman's bracelets suddenly shot off her wrists and also stuck to the windscreen. Richard gasped, trying to breathe. He was being drawn forward. He pressed his hands against the dashboard and pushed himself back, but had to hold himself there with great effort. The car continued moving forward. Richard couldn't trust his senses. The car was silent, but it moved forward inexorably toward that immense, flashing mass. Richard tried to scream again; he opened his mouth but nothing happened. He glanced at the woman, saw blind eyes, and then he looked at the smaller disks. They were at both sides of the car, hovering just above it, each shooting a beam of light down upon it, drawing it forward with them. Magnetism? *Oh, my God*! That's impossible. *Jesus Christ*! Richard pressed himself back into his seat and looked ahead and was terrified.
The enormous craft was there before him. It filled all of his vision. The colored lights flashed on and off, left to right, right to left, then they abruptly blinked off, leaving gray metal gleaming, then the metal appeared to split along the bottom and a long, thing white light emerged.
Richard sobbed and shook. His eyes were wide and disbelieving. He saw a large metal door sliding upward, then his senses were shattered. A dazzling white light all around him. Silhouettes in the haze. The car was picked up and drawn toward the light and then surrounded on all sides. Richard drained out of himself. He let his senses fly away. He opened his mouth to scream but nothing happened, so he simply collapsed.
All white.
Everything.

Chapter Four

It is important that I remember. My time will soon be up. The plastic surgery and the pacemaker and the prosthetics have all been useful, but the liver still manages to elude us and so I must die. I remain philosophical. I have

had more than most. I have lived a long time, made the dream a reality, and I cannot complain because nature still hides its secrets.

We never conquered the liver. Perhaps we never will. Now I start to degenerate, feel the hardening of my veins, and my memory is not what it was and too often betrays me. No matter: it is done. We cannot be stopped now. The sun glitters off the ice as I write – and the ice is the New World.

It is important to remember. Some fragments, if nothing else. It was all so long ago, so far away, and now it seems like a dream. My parents: not important. We are blessed and cursed by birth. Two very ordinary people heading nowhere, myself growing under them.

I detested my childhood. This much I do remember. Long days in the Midwest, clouds of dust over the flatlands, my father and mother in the fields, bending over their crops. They were simple, decent people. I can scarcely recall them. They talked little and they worked very hard and received scant reward. Detested it. Yes. The days stretched out forever. As a boy, still a child, how young I don't remember, I spent hours gazing up at the stars and wondering how I could reach them.

I've never understood emotions. An aberration of the weak. I am thinking of what they call 'love' and its attendant illusions. They would call me a genius. By their terms they might be right. From the beginning (I remember this well) I was always obsessed. An emotion of a different sort. Not a need for human warmth. I saw humans in biological terms and thought the world a laboratory. The obsession was with knowing. It was all within the mind. Anything outside the mind – the need for love or material gain – was no more than a degrading manifestation of our primitive origins. What matters in Man is mind. I have always believed that. Even then, as a child, about ten years old I think, I believed that (or felt it) and lived it and would not let it go.

They would call me a genius. I would say 'integrated'. My mind and emotions were fused to perform in calm harmony. No weakness. No digressions. My flesh never defeated me. Even later, as a young man, in the offensive throes of puberty, I would hold my yellow semen in my hand and try to sniff out its properties. The vas deferens and the seminal vesicles, the

bulbo-urethral and prostate glands: my ejaculations were examined biologically and found to be normal. I thus conquered such distractions. I took the semen on my tongue. Various liquids and sperm, two hundred million spermatozoa; orgasm thus became a form of research and lost its great mystery.

Hard to believe it now. All so very long ago. My parents ignorant with a Bible on the table, my head in the stars. The small farm was a prison. My decent parents were viewed as wardens. A teenager, isolated, my head bursting at the seams, the lack of books, or the means of education, drove me close to insane. I knew I was exceptional. I felt trapped by circumstances. Two or three times I ran away from home, but I was always brought back. So, I detested it. I just had to get away. This much I remember about my childhood: I grew up in Iowa.

Such a long time ago. The late 1800s. I remained a prisoner by lieu of my background and suffered accordingly. A genius, by their terms. Had to be, even then. For my birthday, I received a microscope and then examined my own sperm. Fourteen? Fifteen? I can't remember my age. In my room, I took my penis in my hand and let the semen stain slides. The mystery of life was in biology. Ejaculation was mere phenomena. I thus reduced my shifting yearnings and dreams to their most basic nature. The human body was just a vessel. Without the mind it was superfluous. I learned early, and had no cause to doubt, that the mind took precedence.

Science. That is all. The pursuit of knowledge was all that mattered. Even then, growing up in Iowa, I had no other yearnings. The death of my mother pleased me. There was nothing personal in it. A good woman, she died as people do, and that gave me release. My father sold the farm. He took a job in Massachusetts. A small town, I don't recall the name, quite close to Worcester. Thus was I set free. Universities and libraries. My mind was filled with energy and light and I crammed it with knowledge. The Worcester Polytechnic Institute. I wonder what they called it then. I remember that I came alive there and realized my potential.

What year? Does it matter? I think 1888. Then the Massachusetts Institute of Technology and the thrill of logical thinking. I was an outstanding

student. I was not very popular. The thrill was in logic, but the nightmare was in people: my genius isolated me completely from the other students.

I don't remember caring much. I don't believe I cared at all. (Goddard would later suffer the same, and he, too, was a genius.) The behaviour of fluids at MIT. Wind pressure on surfaces. The dream of flight was what kept me alive and made the world seem more bearable. I rarely socialized. I only stopped for food and sleep. The dream of flight was my dream, aerodynamics my taskmaster, and my genius drove me forward relentlessly and would not let me rest.

Inhuman? I wonder. I have often thought about it. Not then, but later, when I succeeded, when the skies shed their secrets. Yes, only then. I certainly thought about it then. Repulsed by abstract emotions, by the human need for self-esteem, by what was known as love and affection, I lived without women.

I think I tried once. There are vague recollections. Not inhuman, I must have been concerned that they would see I was different. A girl with auburn hair. Perhaps a redhead or a blonde. Spreadeagled, her flesh as white as snow, her soft words unbearable. I tried, but I failed. I saw her body as meat. The act of love was as primitive and functional as eating and shitting. I do not recall passion. My rhythmic thrusting was demeaning. My partners' groanings drove me back into myself and made me think scientifically. I studied my probing penis. The parting vulva held no charms. Her heaving body and my downward thrusting loins lacked aesthetic refinement. The caves are just behind us: this one thought I remember. Perhaps I thought of the spermatozoa in the womb and wondered how to control them. Such much for the act of love. My mind would not let me succumb. I gave up and returned to masturbation of a functional kind. This act was not for pleasure. The point was to kill the need. And my hand, which stroked my flesh without guilt, was just a means to an end.

As for love: a mere illusion. Love is nature's slyest trick. The emotion called love is but a tool in nature's great building plan. Love encourages procreation. It protects the helpless young. Its true purpose is not to exalt us but to make us continue. Thus did I view it. I reduced it to biology. Love was no more than the semen in my hand, but it could be destructive. Men lived

their lives for love. This made them weaker men. The need for love and admiration (for selfeffacement and inner power) was the need that made them abuse their full potential and remain close to primitive.

The possibility was intolerable. I never wanted to let it happen. My genius, the ruthless brilliance of my mind, would not let me accept it. Thus I lived for my studies. I never let my flesh defeat me. My sexual needs were appeased by my own hands or by whores; my body's hungers were not confused with love and could not then distract me. No, I wasn't popular. The other students thought me strange. I think now of that time, of the bliss of isolation, and realize that my devotion to my mind made me someone unique.

My fondest memories are not of people. My fiercest pleasures all came from facts. Angles of wind attack, lift, drag and airspeed: the experiments with the wind tunnel in the basement of Eng A, the revelations of the vane anemometer, the Lawrence Hargraves experimental reports, Sir Hiram Maxim and his engines and propellers, my mind glowing, expanding. The dream took root then. I wanted the conquest of all knowledge. I had a dream of a society devoid of conflict and dissension, a society subordinated to science and its ultimate truths. I had that dream and lived it. I devoted my whole life to it. And now, looking out at the glittering ice caps, I feel deep contentment.

I never accepted the impossible. I refused to recognize it. I learned with a speed that was thought to be abnormal, living only for the lectures, for the libraries and wind tunnel, my hands black with oil, my eyes red from too much reading, breaking down and analyzing my teachers' words, then racing ahead of them.

My father died in that time. I can't remember the funeral. A kind man, he had lived an aimless life and the lesson was clear to me. Nothing mattered but the mind. Common emotions were mere distractions. What mattered was the grandeur of science and where it might lead us. And so I continued studying. My intellect left me no choice. Then Sibley College, Cornell University, in Ithaca, New York.

All things were possible there. More than most of the students knew. I do not remember faces, but I do remember names: Rolla Clinton Carpenter, Octave Chanute, Oliver Shantz and Aldred Henry Eldridge and quite a few others. Machine design and construction, experimental engineering, electrical and mechanical engineering and aerodynamics. These courses were in their infancy, were the products of the New Age. It was an age of scientific innovation and grand aspirations. A Bachelor of Science in Aerodynamics. I remember that from Sibley College. I believe I gained it in 1895, but I cannot be sure of that.

How stupid people are. How stupid they always were. The only emotion I can still entertain is that of contempt. For what they did to me. For what they later did to Goddard. They tried to use us and cast us aside and then control our creations. I think of the businessmen. I also think of politicians. Commerce walks hand in hand with politics, and both are corrupt. Man's purpose is to build upon his past and thus conquer the unknown. All other aspirations are pointless: they are only of the moment. This is the dream of science. It is logic, not emotion. It is a logic that is not shared by businessmen or politicians – nor by the mass of normal men who mostly live without purpose. Such men have no real logic. They are moved by base hungers. They are blinkered and retain a narrow view that will never be broadened. They think only of the present. Their future is here and now. They take genius and fear it and use it and then cast it out. I did not know this soon enough.

Within the ice is the New World. Beyond it is the old. I look beyond the glinting plateaus and think of where I came from.
What an age it was then! So magnificent, so blind. An age of flowering genius, of corrupt commerce and politics, an age of the most insoluble contradictions, of builders and wreckers. I did not know soon enough. They financed me and used me. They took my enthusiasm and brilliance and then tried to pervert it. Yet what if I had known? Out of college, a BS in Aerodynamics, I had to take whatever they offered me.
Finance. Equipment. The world opened up to me. The secret hangars in the wilds of Illinois formed my bridge to the future. Myself and some others. The very cream of young scientists. Sworn to secrecy, we worked night and day to make miracles commonplace. We tolerated the businessmen. We

rarely thought of the politicians. With the innocence of all passionate dreamers, we just worked for our pleasure. What year was that? Probably 1895. A full year before Langley's first successful test flights, we had already surpassed the airships and were moving toward greater things.
The work never ceased. The secrecy was total. More hangars in Iowa, in the Gulf of Mexico, yet another in a place near Fort Worth, all producing components. My first lesson in secrecy: a wide spreading of the work force. Who would know in Iowa or New Mexico or Fort Worth what the individual parts they were making would ultimately form? Thus we moved forward. Thus did I create them. The skies opened up and gave me their secrets and the dream became real.
The second lesson in secrecy: that men will not believe their eyes. Or that men, if they do believe their eyes, will be ridiculed for it. We flew right across the country. The huge winds and rotors glinted. They were very primitive flying machines, but they must have looked awesome. And so we could land. Our crude flying craft needed water. And like all young men who feel that they are conquerors, our mood was ebullient. We played jokes on those who saw us, told the truth and then told lies, and later, when we read the newspapers, we knew the ruse had succeeded.
Such a secret cannot be kept. Nevertheless, it can be protected. To protect a secret you must give away part of it and turn it into a rumor. Who mixed half-truths with lies. Speculation did the rest. Who believes what they now see in the skies and can say so with ease? The world's governments understand this. It is a tactic they learned from me. We flew across the length and breadth of America and were never discovered.
All else was superfluous. It was fodder for the masses. Langley's flying machines, the Wright brothers' manned flight, the later flights of Wilbur Smith and Louis Blériot – all were highly publicized trifles. Such events were mere distractions. The real progress was made in secret. By 1904 we had crossed the Pacific Ocean, and our lights, which were seen by the US Navy, were called natural phenomena. Such descriptions were reassuring. I had no desire for glory. My one wish was to continue my life's work without interruptions.
How stupid they are. How stupid they always were. Now they see us in the skies and close their eyes and still refuse to believe it. That's why we are winning. That's why we could never lose. They could never accept what is possible – but for us, all things are.

Chapter Five

Epstein stood like a ghost before the open door, hesitant, his heart beating uncomfortably, feeling nervous and childish. He was nervous because the door was open, because the house was in darkness, because Irving Jacob's death and his own failing health had reminded him of life's callous betrayals, its indiscriminate brutality. Now, in the darkness, in the silence of Camelback Hill, preparing to step inside and loathing the thought of doing so, he trembled with a youngster's baseless fear and was ashamed of himself… Irving's death and Mary's grief; his own mortality and passing time; he grew old and his childhood returned with all its haunting uncertainties… Had Irving committed suicide? Or had he been murdered? Why was Mary's front door wide open? Dr Epstein, stoop-shouldered and disconsolate, felt close to ridiculous.

Too melodramatic for a scientist. Perhaps the chief of police had been right. Epstein stood on the porch and looked up to see the sweeping night sky. The stars glittered above the clouds, the latter wispy and sullen, drifting languidly, serene and mysterious, the black sky over all. It was quiet up there. Empty. Epstein shivered and lowered his gaze. He saw his own shadow trailing out from his feet, his unreal other half. We are not what we appear to be, he thought. We live and die in ignorance. He felt deep grief, an aching loss, then he knocked on the open door.

'Mary? Are you in there?'

There was no response. The darkness led into silence. Epstein shivered and then stepped inside, wondering what he would find there. The hallway led past closed doors, through the kitchen, into the living room; he saw the back of Mary's head above the back of a chair, the chair facing a garden. Mary's head was very still, her black hair turning gray, and Epstein stood there, transfixed, seeing moonlight in the garden, and then coughed and whispered Mary's name, the pain twisting inside him.

'Frederick?'
'Yes.'
'I thought you would come.'

‘Is that why you left the door open?’
‘Yes.’
‘That was dangerous.’
Mary chuckled sardonically, still seated in the chair, facing the

moonlight that fell on the garden beyond the glass doors. Perhaps it was the grief, a release from her shock; nevertheless, the chuckle cut through the silence and made Epstein wince. He had come here prepared for tears, for hysteria or rage, but now, in the presence of that ghostly chuckling, he felt only bewilderment.

‘Dangerous?’ Mary said bitterly. ‘You think an open door is dangerous? Irving kept the doors closed all the time – but then he went for a drive. What’s a closed door these days?’

The moonlight stretched out to the chair, glinting off her grayblack hair, the back of the chair bisecting her neck, the space around her in darkness. Epstein coughed into his fist, feeling slightly absurd, then he nodded, a silent gesture of agreement, and sighed and sat down just behind her.

‘You saw him?’
‘Yes, I saw him.’ Epstein sniffed and rubbed his short beard. He was staring at the back of Mary’s head, at the dark, silent room. ‘He’s been brought into Phoenix.’
Mary leaned forward and sobbed, covering her face with her hands, bent over in the chair, in the moonlight, trying to choke back her weeping. Epstein watched her, feeling helpless, filled with grief and despair, recalling better days, her smiling face, before the work became dangerous.
‘*Please*, Mary,’ he said.
‘It’s all right, I’m all right.’ She straightened up and wiped her face with one hand. ‘Oh, my God, what a day it’s been.’
‘If I can do anything… *Anything*.’
‘You can’t do anything. He’s dead.’
‘I just thought…’
‘There’s nothing to think. He’s dead. It’s all over. Finished.’
She was sitting up straight again, staring into the moonlit garden, a clenched fist shoved into her mouth, knuckles tapping her teeth. Then she sighed and stood up, went to the windows and walked back, turned her

chair around and shook her head sadly and sat down facing Epstein. The moonlight formed a halo above her. Epstein saw her tearwashed eyes. She was in her middle forties but her face retained its beauty, an elegant mask now ravaged by loss, the eyes brown and large. Epstein sat there before her, feeling defeated, his love for her and Irving boiling up and turning rancid with guilt.

'Here in Phoenix,' Mary said softly.

'Yes,' Epstein said. 'The autopsy.'

'And presumably they'll call me tomorrow?'

'Yes… The arrangements.'

Mary nodded and sighed, her gaze roaming around the room, her white hands twitching restlessly in her lap, trying to hold on to something.

'Why did you come here?' she asked.

'You knew I'd come, Mary.'

'To offer your condolences?'

'Yes.'

'And to ask me some questions.'

It was a mean, honest statement, making Epstein recoil within, flushing, the guilt rushing through him as he stared at her grim face.

'Yes,' he said. 'I can't help that.'

Mary nodded, smiling bitterly. 'You just never give up,' she said. '*All* of you. You just can't give up, no matter what happens. I suppose I should accept it – the good wife supporting the cause – but I can't. And now Irving is dead. So to hell with your institute.'

'I have to know, Mary.'

'You have to know what? That my husband was driven mad by his work and now he's found peace at last? There's your answer. Go home with it.'

'No,' Epstein said. 'I don't think that's the answer.'

'Yes, it is. It's the only answer available.'

'I don't think it was suicide?' Epstein said. 'I feel I should tell you that.'

The anger was quick to come, flashing out of her brown eyes, her head shaking from side to side in denial as she rose to her feet. She looked down at him, this old man, this professor who felt his age, and her lips, a tight line below the pert nose, spat out all her grief.

'Damn you!' she snapped. 'Damn you and your pride! It's not that you don't believe it – it's that you *can't*… because you need your obsession. Irving committed suicide. Your work drove him half crazy. He couldn't

sleep, he couldn't eat, he started ignoring his whole family, and it happened because of your damned obsession, your belief in conspiracies. Of *course* he didn't kill himself! Of course it *has* to be murder! You've been at this game for twenty-five years, so now it has to be *something*!'
'Please, Mary… That's not fair.'
She shook her head and turned away, went to the windows and came back, started walking to and fro in agitation, her hands slapping her thighs.
'He was a scientist,' she said. 'He wasn't cut out to be a detective. He studied physics at Berkeley, designed nuclear reactors, worked for NASA and the American Nuclear Society, had an entry in *Who's Who*. My husband was a fine man – an intelligent and decent man – then you involved him in your UFOs, in your speculations and intrigues, and he fell for it and became obsessed with it and paid the full price. Do you know what it was like watching him? Seeing him crack and fall apart? Can you possibly understand what it's like to see your husband go down that way?'
'He was frightened,' Epstein said.
'Damned right, he was frightened. You and your damned institute, your associates, you frightened him to death.'
'It wasn't us,' Epstein protested.
'It was you,' Mary said. She stopped pacing and just stood there, looking accusingly at him, her brown eyes bright with tears.
'Damn you,' she said.
Epstein had to look away, his gaze roaming around the dark room, taking in the familiar paintings, the furniture and ornaments, all the items he had seen through the years that he had visited this place. Those days were gone now. They had gone with Irving's death. It couldn't ever be the same again – not for him, not for Mary. Epstein shivered with grief and rage that matched the woman's. He wanted to reach out and console her, but he didn't dare touch her.
'I saw it coming,' Mary said. 'It had been coming a long time. He wasn't able to fighting his old friends and it tore him apart. I saw it back in 1968, during the House Science and Astronautics Committee Symposium, when he stood up and stated that he had come over to your side and now believed in the existence of the UFOs. He should never have done that.'
Epstein didn't respond. There was nothing he could say. He simply had to let her talk it out, no matter how much it hurt him. Knowing this, he just sat there, watching her carefully with his tired eyes, as she paced to and fro

across the room, from darkness to moonlight.
'It was after that,' she said. 'That was when it began. He believed in it all, gave lectures and interviews, and then, when he started losing his credibility, he simply *had* to believe it. Why not indeed? It was all he had left. First, he was a senior physicist at the University of Arizona, next thing he was a member of your institute, another crank chasing UFOs… You think I'm being cruel? Well, so be it. As far as I'm concerned, he fell in with a bunch of scientific quacks and was ridiculed for it.'
'You don't believe that,' Epstein said.
'Yes, damn you, I believe it. Irving was a physicist, a man of some authority, but then, when he championed your cause, he lost everything… *Everything*!' She almost chocked on the last word, actually had to catch her breath, then she blinked repeatedly, looking dazed, and slumped into her chair. 'Jesus Christ, I feel ill,' she said.
Epstein flinched when she wept again, felt himself recoil with shame, averting his gaze when she reached for her handkerchief and dabbed at her eyes. He thought briefly of Irving, of his passion for the truth, of how that passion had led him inexorably into the UFO controversy. Epstein hadn't seduced him. Irving had joined of his own accord. And then, as had happened to so many, something happened to Irving… Epstein thought about it briefly, tried to cast it from his mind, and looked up, feeling pained and confused, to see Mary's dark eyes.
'It was you,' Mary said. 'I don't want you to forget that. If it hadn't been for you and your institute, he would still be alive.'
She burst into tears again, bent over in the chair, moonlight falling on the back of her head as she shook it from side to side. Her sobbing was loud and wracked, filled with pain and despair, and she pressed both hands to her face as if to blot out the truth. Epstein sat there, saying nothing, too stricken to offer sympathy, deeply wounded by what she had said, wondering how he could live with it. Then she sobbed even louder, her body shaking in a fever, so he stood up and went to her chair, bent down to her, embraced her.
'Oh, God!' she sobbed brokenly. 'It's a lie! It's all a lie! It's tearing me apart and I can't take it and I have to strike out. It wasn't you, Frederick – I *know* it wasn't you – *God, it's all such a mess*!' She pressed her face to his thigh, her tears flowing, head shaking, holding on to him as if he might vanish and leave her with nothing. Then she looked up at him, her face pale and distraught, and he saw the brown, luminous eyes, stunned with

incomprehension. ‘What was it?’ she sobbed. ‘How did it happen? Was it me? *Was it me*?’
He lowered himself to his knees beside her, held her face in his hands, gently shook her head from side to side, murmuring words he would not recall. Eventually, she calmed a little, wiped her eyes dry, sighed, sinking slowly back into her chair, staring up at the ceiling.
‘No,’ Epstein said. ‘It wasn’t you. It had nothing to do with you.’
‘It was suicide,’ she whispered.
‘It wasn’t suicide,’ Epstein said. ‘Irving wasn’t the type to commit suicide. We both know that’s a fact.’
‘Then what…?’ She shook her head from side to side. ‘I just don’t understand… Why on earth…? Who would want to…?’ She shook her head again, bit her lower lip. ‘*I don’t understand*!’
Epstein sighed and stood up, disappeared into the darkness, returned with two glasses of bourbon and handed one to her. She took it gratefully and drank it down, gasped for breath, put her head back, stared up at him as if not quite awake, moonlight touching her pale face. Epstein sipped at his own drink, looking thoughtful, undecided, then he sat in his chair and stared at her, speaking quietly, convincingly.
‘Listen to me,’ he said. ‘I didn’t encourage Irving to join the institute. He wrote to me and suggested we work together. In fact, Irving had been privately interested in the UFOs from about 1955, and the 1965 wave had merely strengthened his growing conviction that the phenomenon had definite scientific importance. Irving never officially joined the institute; his only connection was that he would trade information with us and help us by proxy with his specialized knowledge. It *is* true that he visited us in Washington DC a few times, and that by the time he had gone through our files he had become convinced of the reality of the phenomenon. But I repeat: Irving did all of this on his own – not because we encouraged him.’
Mary studied him carefully, her eyes illuminated in moonlight, the rest of her face in deep shadow, darkness swimming around her. She seemed calmer now, more thoughtful, alert, and she studied Epstein’s face as if whether deciding to talk or keep silent. The tension between them was palpable, filled with doubt and recrimination, but eventually she sighed and leaned forward and gave him her glass.
‘I need another,’ she said.
Epstein nodded and stood up, disappeared into the darkness, returning with

two glasses of bourbon and handing her one of them. She didn't say anything, simply turned the glass around, watched the moonlight flash on and off it like tumbling diamonds. Epstein sat down again, crossed his legs, sipped his drink, determined not to push her too hard, to let her take her own time. Finally she drank some bourbon, licked her moist upper lip, then sank wearily back into her chair, lost in shadow once more.
'Okay,' she said. 'What do you want to know?'
'I want to know what frightened Irving,' Epstein said. 'Or what you *think* might have frightened him.'
Mary shook her head and sighed. 'God,' she said, 'I don't know. At least, I'm not very sure. It just seems too ridiculous.'
'Ridiculous?'
'Yes, ridiculous. He never really told me what frightened him. I can only make guesses.'
She leaned slightly forward, elbows resting on her knees, the moonlight falling over her head and glinting off the small bourbon glass.
'You've heard of Dr James E. McDonald?'
'Of course,' Epstein said.
'Then you'll know that McDonald was once at the University of Arizona, senior physicist in the Department of Atmospheric Sciences and a leading proponent of the extraterrestrial hypothesis.'
'Yes,' Epstein said. 'It's common knowledge.'
'Okay. Now Irving certainly didn't agree with all of McDonald's theories, but he *did* respect McDonald enormously for his courage in putting forward his unpopular opinions. Indeed, if anyone may be said to have influenced Irving, McDonald would have to be that man.'
'So?'
Mary shrugged. 'Back in 1967, when the Condon Committee was being set up, McDonald was on a visit to the Wright-Patterson Air Force Base in Dayton, Ohio, when he accidentally saw the classified version of the 2953 Robertson Panel report. McDonald was shocked to discover that the CIA had had a large hand in the report, and that the classified version of the report, apart from deliberately ignoring some of the most positive UFO sightings, had secretly recommended what amounted to a national brain-washing program and a complete coverup of official UFO investigations. So, in early 1967, after seeing the classified version of this report, McDonald linked the Air Force's notorious secrecy policies to the CIA and,

on the same day that the Air Force announced the establishment of the Condon Committee, made this controversial information public. Naturally, Irving – who had widespread connections with the scientific community and the media – helped him in this. And from that day on, both he and McDonald became loudly vocal critics of the Air Force *and* the CIA.'

'Are you trying to tell me that Irving was frightened of the CIA?'

Mary shrugged again, sighed heavily, gazed around her, the bourbon glass resting on one knee, her free hand lightly stroking it.

'I don't know,' she said. 'I think he was certainly worried about it. I think that by this time he was beginning to understand that you couldn't wade too deep in those waters. You know, McDonald was in the forefront of all this, and Irving was well aware of what was happening to McDonald. McDonald attacked the Air Force and the CIA relentlessly, and by 1969 the word was out that those organizations wanted to silence him. Whether this was true or not, it was certainly pretty obvious that McDonald was not having an easy time. The major defenders of the Air Force's attitudes toward UFOs were Harvard astronomer and author Donald Menzel, and Philip Klass, avionics editor of *Aviation Week*. Menzel had repeatedly explained most of the sightings – including the famous Washington DC sightings – as reflections, mirages, ice crystals floating in clouds, or the results of refraction and temperature inversion. On the other hand, Klass, a man fervently opposed to the extraterrestrial hypothesis and particularly opposed to McDonald, continually tried to ridicule McDonald and put forward his own theory that all UFO sightings were due to coronal discharges in the atmosphere. Anyway, McDonald tore these theories to shreds and made himself a couple more enemies. According to McDonald, Klass tried to ruin him by telling the Office of Naval Research that he, McDonald, had used Navy funds on a trip to Australia to study UFOs, This caused a hell of a scandal and led to the Navy sending an auditor to look at McDonald's contract and expenditure. The Navy found nothing to pin on McDonald, but it still caused McDonald embarrassment and gave him a lot of problems with the university administration. Then, as McDonald continued to expose Air Force and CIA shenanigans, things grew progressively worse for him. More and more professional ridicule was heaped on him, until, in 1971, the House Committee on Appropriations called him to testify about the SST supersonic transport plane. During his testimony, he was constantly mocked as the man who saw little green men flying around in the sky. McDonald's

work on the SST was his last project. In June 1971, at the age of fifty-one, he drove himself into the desert and shot himself in the head – exactly like Irving.'

Mary suddenly shivered and shook her head from side to side, a clenched fist going to her mouth as if to stifle a sob. She took a deep breath and sank back, her face disappearing in darkness, then the glass of bourbon glinted in the moonlight as she had a stiff drink. There was silence for a long time. A clock ticked on the wall. Epstein hadn't heard the ticking before and it made him feel strange.

'Do you think there's a connection?' he asked.

'I don't know,' Mary said. 'It just seems too ridiculous. But I do know that *Irving* thought about it… and it certainly frightened him.'

'Why?'

'Oh… various things.' The glass came down from her lips to rest on a knee, her fingers curving lightly around it, her wedding ring glinting. 'You know, some strange things have happened to a lot of people involved with UFOs – accidents, suicides, the loss of formerly strong careers – and Irving started taking an interest in such cases. This was shortly after Dr McDonald's suicide – and also after Irving had started his heavy drinking.'

'The drinking was really bad?'

'Yes, *very* bad. I'd never known him to drink before, but then he started to drown in it.' She shivered again, shook her head in a dreamy manner, raised the glass to her lips and had a sip, sighing deeply, forlornly. 'Irving was particularly fascinated by the career of Captain Edward Ruppelt, who headed the Air Force's UFO investigations from 1951 to 1953. According to Irving, Ruppelt was the best man the Air Force ever used during their twenty years of UFO investigations; however, during his three years as head of Project Blue Book, Ruppelt became increasingly convinced that the UFOs were real and of extraterrestrial origin, and that the Air Force was antagonistic to such a hypothesis. According to Irving, this was why, when the Robertson Panel submitted its formal conclusions to the CIA, the Pentagon and the higher echelons of the Air Force, the CIA refused to give a copy to Ruppelt and his staff. And from that point on, Ruppelt, who was critical of the whole Robertson Panel, found the ground being cut from under his feet. Apparently Ruppelt had been determined to mount a full-scale UFO investigation but faced a lot of opposition from the Pentagon, until, by mid-1953, the Blue Book staff had been stripped down to a total of

only three people: Ruppelt and two assistants. Consequently, Ruppelt left Blue Book permanently in August of that year, went to work as a research engineer for the Northrop Aircraft Company, and also wrote his famous book on UFOs.'

'*The Report on Unidentified Flying Objects*.'

'Right. Now what bothered Irving about this case was the fact that Ruppelt's book was a forthright attack on the Air Force's handling of the UFO phenomenon and a plea for a more honest and intensive investigation of it. Obviously, Ruppelt was a believer… Yet in 1959, three years after he had first published his book, Ruppelt revised it, totally reversed his previous stand, and stated in the new edition that UFOs as a unique phenomenon did not exist. One year later he died of an unexpected heart attack.'

Mary finished off her bourbon, placed the glass on the floor, and leaned forward until her face was back in the moonlight, her brown eyes large and misty.

'Irving was bothered by the case,' she said. 'He couldn't understand Ruppelt's reversal. He investigated the case thoroughly, interviewed a lot of people, but couldn't really come up with anything conclusive. There was the possibility that Ruppelt had just become fed up with it, with the constant controversy that surrounded the subject, with the media and the crackpots who hounded him night and day. A possibility. A thin one. Certainly Irving could never accept this as an answer, and he never stopped pondering the riddle. Possibly because of this, he became involved with a similar case: that of Dr Morris Jessup, the noted astronomer and selenographer.'

'I thought *he* was a crackpot,' Epstein said.

'Well, he may or may not have been. In his defense, it's worth noting that he was a teacher of astronomy and mathematics at the University of Michigan and a researcher whose work led to the discovery of thousands of binary stars. In short, Jessup was an astronomer of considerable repute – until he became obsessed with the UFOs. Apparently, once that started, his ideas became a little crazier, more speculative and bizarre, some derivative, but others strikingly original. As Irving frequently said, this wasn't all that unusual: a lot of people who developed an interest in UFOs tended to turn pretty strange. Anyway… Irving was interested in Jessup because Jessup had been conducting investigations into possible Naval experiments with field forces that could temporarily dematerialize matter or somehow make it invisible. While this sounded pretty crazy to me – a sort of Flash Gordon

fantasy – it interested Irving in the sense that he often felt that the UFOs might work on just such a principle. So… Dr Jessup had been investigating what had been known in books, magazines and various scientific journals as the Philadelphia Experiment.'

'I know about it,' Epstein interjected. 'Allegedly, during 1943, the United States Navy conducted a series of tests at the Philadelphia Navy Yard, at Norfolk-Newport News, Virginia, and at sea to the north of the Bermuda Triangle. Reportedly the experiment was at least partially successful, the ship used being the USS *Eldridge*, and its disappearance allegedly being seen from the decks of the Liberty ship SS *Andrew* and a cargo ship, SS *Malay*. Reportedly, after disappearing, the *Eldridge* reappeared at its berth in Norfolk, then mysteriously turned up at its original dock in the Philadelphia Navy Yard. And according to other unsubstantiated reports, some of the crew died, many had to be hospitalized, and more than a few had gone mad.'

Mary nodded agreement. 'As I said, Irving was interested in this because he through that the seemingly incredible materialization and dematerialization of UFOs might somehow be based on unusual, controlled magnetic conditions in which the attraction between molecules could be altered temporarily to cause the transmutation or transference of matter.'

'A sort of space-time machine.'

'Exactly. Matter simply dematerializes and materializes elsewhere – hey presto! Space and time don't exist.'

Epstein raised his eyebrows. 'Go on,' he said.

'Okay. I know. It sounds crazy. Anyway, Irving followed this up and discovered that in 1959, the same year Ruppelt performed his abrupt about-face with the revised edition of his book, Jessup informed Dr Manson Valentine – currently curator honoris of the Museum of Science of Miami and research associate of the Bishop Museum of Honolulu – that he had reached some definite conclusions regarding the Philadelphia Experiment and wanted to show Valentine his manuscript. According to Valentine, he arranged for Jessup to come for dinner on the evening of April 20 that year – but Jessup never made it that far. According to the Miami police, Jessup, some time before sixthirty that evening, drove his car to Matheson's Hammock in Dade County, Miami, and committed suicide by attaching a hose to the exhaust of his car and running the hose inside the vehicle.'

'Was the manuscript found in the car?'

‘According to the Miami police report, no.’
Mary rubbed at her forehead and swept the hair from her eyes, then she stood up and visibly shivered and started pacing the room. Epstein watched her, entranced. She was lovely, and she was also a stranger to him, a shadowy figure in the moonlight.
‘That made Irving worse,’ she said. ‘He started to drink even more. He wouldn’t talk about it unless he was drunk, and then he seemed incoherent. Incoherence or craziness? I swear to God, I don’t know. He was obsessed with the idea that important UFOlogists were marked men, that they always ended up in a bad way, either crazy or dead. He pointed out to me that Ruppelt had had a lot of problems during his final few years and that those problems might have contributed to his heart attack. He reminded me constantly about McDonald’s last few years, about the Air Force’s fear of him, about his low standing in the eyes of the CIA and the ridicule heaped upon him by his fellow scientists. Then, on June 12, 1972, precisely one year after McDonald’s suicide, another proponent of the UFO phenomenon, scientist and inventor Rene Hardy, was found dead, apparently a suicide by bullet – and this made Irving paranoid.’
She stopped pacing and stared around her, eyes blinking, slightly unfocused, then she bent down and picked up her glass and disappeared in the darkness. Epstein listened to the bourbon being poured, felt the tension within himself, wondered how they had all come to this… to this fear and confusion. When Mary returned, the glass already to her lips, she drank and gazed around her again and then sat down, her legs crossed, her hands shaking.
‘Irving had problems sleeping. He started pacing the house each night. He would get up and pace around his study, muttering under his breath. He often looked out the windows. He always looked up at the sky. He started saying that *they* were coming to get him… I never found out who *they* were. He’d been working on something special. He was very secretive about it. The more he worked, the more frightened he became and the less he could sleep. Then one night he was really drunk. I drank with him and we talked. I asked what it was that had him scared, and he attempted to tell me. It wasn’t easy for him. The drink had made him incoherent. He started babbling about his colleagues, about how the ridicule had increased; he said the university was putting pressure on him and he might have to leave. Naturally I was shocked. God knows, I was shocked. Then he said that he

thought he was being followed, that he just had this feeling.'
Mary shook her head and sighed. She seemed remote and somehow lost. She gazed at Epstein and he saw her brown eyes, the pain buried behind them.
'There are lots of stories,' she said, 'about mysterious men who contacts people investigating UFOs. Since most of these stories come from the lunatic fringe, they're rarely given serious attention. Nevertheless, they worried Irving. He told me that in 1955, during that famous UFO flap, Dr Jessup had been called in for an interview at the ONR – the Office of Naval Research in Washington, DC. There it was explained to him that one of his books had been mailed to the chief of the ONR, Admiral Furth, and had subsequently been examined by both the ONR Special Projects Office and the Aeronautics Projects Office. Precisely what was then said between the ONR and Dr Jessup remains unclear, but according to Irving, Jessup started having severe personal problems from then on – and those problems led directly to his suicide… Crazy, yes? Well, *I* thought it was crazy. No matter: the story fascinated Irving and fitted in with his theories.'
She had another sip of bourbon. The clock ticked on the wall. Epstein thought of what the police of chief had said… something about melodrama.
'Irving thought he was being followed by three men,' Mary said. 'He had seen them in a car, outside the house, outside his office, and he felt that they were coming to get him and take him away. Of course, I didn't believe a word of it. I put it down to his illness. I just thought that all those stories about mysterious, nameless visitors, men usually dressed in black, had sunk into his subconscious and mixed in with his increasing paranoia. But Irving was adamant. He couldn't let the subject go. He talked about how a lot of the UFOs were described as being surrounded by a glowing, plasma-like cloud; about how the USS *Eldridge* had also been described as disappearing within a luminous green cloud; about how the Bermuda Triangle and the Devil's Triangle are on approximately the same line of longitude and how many of the airplanes and ships that were lost in those areas were often described as disappearing in similar clouds. Irving thought there was a connection. He thought Jessup had found the connection. He thought that the disappearing airplanes and ships were tied in with the UFOs, and that the Navy might have stumbled onto the truth through the Philadelphia Experiment. Irving also talked a lot about McDonald, about Edward Ruppelt and Rene Hardy, about how too many reputable people had come

to a sticky end – and about the mysterious men in black who harassed UFO witnesses, often claiming that they were from the CIA. All of this scared Irving. It made him pace the house at night. Then, just a few days ago, Irving read about Chuck Wakely… and that final bit of news was too much for him.'

'Chuck Wakely?'

'Yes. Chuck Wakely was a young Miami pilot who almost lost himself in a luminous cloud above the Bermuda Triangle. He was so shaken by his experience that he started to investigate the whole subject – writing about it, lecturing about it, appearing on TV and radio, and generally digging up a lot of old bones. A few days ago Chuck Wakely was shot through the window of his apartment in Miami, reportedly while working on his research. The motive and assailant are still unknown.'

'Coincidence,' Epstein said.

'Maybe,' Mary said. 'But that coincidence didn't particularly help Irving. In the end he just thought of the men following him – and became paranoid.'

Epstein leaned forward, feeling cold, slightly unreal, his gaze drawn to the moonlight in the garden, to the stars in the night sky. What could he say? What could *anyone* say? The story was too bizarre to be accepted and contained by mere logic.

'What was Irving working on?' he asked.

'I don't know,' Mary said. 'That's what frightens me most. I went through his study today and couldn't find a damned thing.'

'No papers?'

'Nothing.'

'But he *must* have kept a file!'

'He had a file as thick as *War and Peace*, but it's disappeared.'

Epstein sank back again, feeling colder, disorientated, the fear creeping inexorably over him and making the silence sing… Death. Suicide. Careers broken and good men lost. He thought of Irving in his car in the desert, of McDonald and Hardy. Suicide by bullet. Or carbon monoxide inhalation. Suicide and murder and madness: an inexplicable catalogue… Epstein had to know the answers. There was nothing else left to know. He grew old and his time was running out and that invited obsession. Yes, that was the word. *Obsession*: the only word. It was what had taken hold of them all and then driven them ruthlessly. Epstein sighed and leaned forward again, his stubby fingers interlocked, his knuckles forming a broken white ridge that

displayed his great tension.
'A strange story,' he said.
Mary chuckled bitterly, shook her head and looked away, then raised the glass of bourbon to her lips and had another sip.
'That's the story,' she said eventually. 'That's my legacy from Irving. God knows, it's too inane to be true… but that's what it came to.'
She drank deeply of the bourbon, let her head fall back and gasped, her tormented eyes focused distractedly on the ceiling and seeing nothing at all. Epstein watched her, entranced, thinking of days long ago, of when his own wife had been alive and they had sat in this room, feeling young and beyond the reach of time, their whole future before them. A sweet innocence had filled those days, had colored Epstein's fondest memories; now that innocence lay shattered about him and left him with old age. His wife had died five years ago, Irving had killed himself yesterday, and here, in the timeless, moonlit silence, he and Mary were parting. All their dreams had turned to dust. Each possibility had reached its limit. What was left was a teasing, frustrating mystery that might yet make him mad. Epstein studied Mary carefully, saw the fading of her beauty, the spreading of her flesh, the falling breasts, the glint of gray in her black hair. Life approached and then withdrew. It bled away into the night. It was merciless, taking beauty and hope, leaving little to cling to.
Epstein sighed again. He felt old and very tired. He stood up and gazed nervously around him and then stared at Mary. She was still in the chair. He saw the moonlight surrounding her. Her eyes were luminous and wet with rampant grief, and they tore at his broken heart.
'It's getting late,' he said. 'I'd better go. I'll try to drop in tomorrow.'
'No,' Mary said. 'Don't drop in tomorrow. I'll be packing tomorrow.'
Her voice was flat and remote, a stranger's voice, a chilling sound, and Epstein stood there and blinked and stared at her, not quite comprehending.
'Packing?' he said.
'Yes, packing,' she replied. 'I don't want to see you again. I don't want to see anyone.'
He almost sat down again, the shock shaking him, draining him, but instead he simply raised one hand and lightly stroked his beard.
'It's not you,' Mary said. 'It's everything you represent. It's the UFOs and their victims, Irving's hopes and their destruction; and, most of all, it's my fear that he might have been right. I'm too old for this, Frederick. I can't

live within these walls. I want to run from all his friends, from his work and his associates, and I never want to see this house again, to hear a knock on the door. I'm frightened, Dr Epstein. Irving's fears are getting to me. I'm too weak to stay here and fight it, so I'm packing my bags. I'll attend to the funeral. I don't want you to be there. I'll leave as soon as Irving is cremated, and I'll never come back. Give me a kiss, Frederick. Do that and then go. Don't talk to me. Don't say another word. Kiss me once and then leave.'

She raised her big brown eyes. They were stricken and wet with tears. Epstein felt a searing pain, a crippling loss, and then he stepped over to her. The darkness surrounded them, dissolved them and made them one. Epstein leaned down and kissed her on the cheek and then he walked from the house.

Chapter Six

The air-conditioning in the Fontainebleau Hilton, as in most hotels, condominiums and fleabags in Miami Beach, smacked the flesh with a refrigerated chill that stopped sweat in its tracks. Wilson stood in the lobby, glancing around him, gaze thoughtful, taking in the milling people, the WASP residents and tourists, not amused by the superfluous extravagance and inane conversations. He nodded curtly at Fallaci, who stood beside him, looking elegant, and together they pushed their way through the crowd and went up to the desk clerk.

There was a mob at reception, all waving hands and shouting, drunk already and flushed with excitement, trying to sort out their room keys. Wilson stepped back, disdainful, thinking of how common they were, as Fallaci, apparently cool in his white suit, pushed his way to the desk.

'Excuse me – ' he began.

The clerk raised a hand and brushed blond hair from his eyes, the eyes turning toward Fallaci, azure blue, opaque with panic, then returning to stare blindly at a man whose elbows straddled the desk. The man had short-cropped red hair, a blotched face, squinting eyes, a garish terry-cloth shirt on his large frame, a cigar between his lips.

‘No!’ he bawled. ‘You listen to me! You keep your crap for your hookers!’
‘Excuse me – ’ Fallaci repeated.
‘No fucking way!’ the big man bawled. ‘We’ve just been to the Ivanhoe, to the Bal Harbour on North Bay Causeway, we’ve been up and down that road, from Hallandale Beach to Lincoln Mall, and we haven’t been offered as much as a fucking john, and now we’re just goddamn tired of it. What sort of jerk-offs do you think we are? You expect us to sleep on the goddamned beach? What the hell do you mean, you’ve got a convention? We come here every year, bud!’ ‘I’m sorry, sir, but – ’
‘Don’t fucking “but” me, bud! I’m not here for a goddamned snow job. I’ve got a bus full of people, a fucking Eastern Airlines bus, and I’m not about to drive off again. Fuck you, bud. Where’s the manager?’
‘Excuse me,’ Fallaci said, very polite, very firm, taking the desk clerk’s jacket sleeve and jerking the elbow towards him, his tone of voice and steady, insistent gaze making the man take notice. ‘A Mr Vale,’ Fallaci said. ‘He’s coming to see Mr McKinley. Mr McKinley and I have just been for lunch and wondered if he’d arrived.’
‘Goddamned lunacy!’ the big man said. ‘Where the hell’s the goddamned manager?’ The desk clerk glanced at him, licked his lips, stared at Fallaci, looked down at his desk pad and whispered, ‘No, sir. There’s no message.’
‘Fucking madness!’ the big man exclaimed.
‘Excellent,’ Fallaci said. ‘Mr McKinley is in his room and when Mr Vale arrives he wants him to be sent up immediately. Don’t bother to phone.’
‘Yes, sir,’ the desk clerk said, hastily scribbling the details.
Fallaci retreated, smiling politely at the desk clerk, watching the big man slam his fist on the desk and start bawling again, his passengers milling around him.
‘Well?’ Wilson asked.
‘He hadn’t arrived yet,’ Fallaci said. ‘I told the desk clerk to send him straight up without using the phone.’
‘Good,’ Wilson said. ‘Let’s go up there. Let’s see Mr McKinley.’
Together they crossed the flamboyant, rococo lobby, passing ladies in bikinis and one-piece bathing suits, feet in sandals and clodhoppers, hair bleached blond and purple, piled high, hanging low, expensive bracelets on thin, suntanned wrists, rhinestone sunglasses gleaming. Wilson was not impressed, never had been, never would be, now just wanting to collect his man and then get out and leave Miami behind him. Nevertheless, he seemed

part of it: silvery-haired, deeply tanned, his light gray suit businesslike. He might well have been a native of Broward County, just in town for the day.
'What did you tell him?' Wilson asked.
'I said we'd just had lunch with McKinley. He's going to send Vale straight up when he arrives. We won't have any trouble.' They took the elevator to the sixth floor, an extremely crowded elevator, the people noisy and in holiday mood: young girls in skimpy dresses, paunchy men in Bermuda shorts, the former giggling, the latter dabbing at sweat as the elevator moved upward. Wilson stepped out with relief, surveyed the corridor, the bland walls, then he made his way along to room 605, Fallaci trailing behind him.
'This is worse than Las Vegas,' Wilson said.
'I've never been there, sir. Every year, I swear I'm going to go, but I haven't made it so far.'
'This McKinley,' Wilson said. 'You're sure he's never met Professor Vale?'
'He wouldn't know Vale from my mother. That's a hundred percent.'
Wilson nodded. 'I hope you're right. I'd rather not have anything messy. I don't want any problems.'
'This is it. 605.'
They both stopped at the door, a white-painted door with gold embossing. Fallaci glanced at Wilson, saw the nod, and then pressed the doorbell. Obviously Vale was expected – they heard the footsteps within. The door opened without hesitation and McKinley stared at them. He was ruddy-faced, gray-haired, wearing slacks and a flowered shirt, a steely glint in the green of his eyes, no smile on his face. 'Professor Vale?' he asked, glancing from Wilson to Fallaci, his hand still resting on the door, as if preparing to close it.
'I'm Vale,' Wilson lied. He put his hand out to McKinley. They shook hands and then McKinley indicated Fallaci. 'Who's this?' he asked bluntly.
'My assistant,' Wilson said. 'Mr Fallaci. Do you mind? He's clean.'
'You said you'd come alone.'
'My personal assistant. I'm sorry. But Mr Fallaci travels everywhere with me. He knows everything… *Everything*.'
Wilson stepped into the apartment, brushing casually past McKinley, and Fallaci followed with a smile on his lips, a polite smile, remote. McKinley shrugged and closed the door, looking thoughtfully at Wilson, then he waved at the mock-Renaissance chairs and said, 'Fine. Take a seat.' Wilson

remained standing. Fallaci circled the room. McKinley said, ‘You gentlemen want a drink?’ and headed straight for the bar. He was a big man, but muscular, clearly fit, his movements light. ‘I’m sorry about that,’ he said, ‘but I’m sure you understand: in this business we have to be careful; we have to know who we’re dealing with.’ He reached the bar and turned around. ‘The government watches us – ’ he began. His eyes flicked to the right, saw Fallaci, an upraised hand, and he cursed and tried to duck to the side and then knew it was too late.

Fallaci’s hand chopped through the air, turned on edge, the fingers closed, a small guillotine that snapped McKinley’s neck with deadly precision. McKinley gasped and went down, his legs buckling, body spinning, and Fallaci stepped out and caught him in his arms before he cell to the carpet. It had happened quickly, quietly, without fuss, and the dead man now lay in Fallaci’s arms, body sagging, leg’s outstretched. Wilson stepped forward and examined him. McKinley’s chin lay on his chest. He had urinated in his pants and the stain was spreading out around his crotch.

‘Right,’ Wilson said. ‘Get him into the bathroom. I don’t want him dripping on the carpet. Get him in there immediately.’

Fallaci slid his arms deeper under McKinley’s armpits and then, with the lifeless head against his chest, dragged him into the bathroom. The walls were a lurid pink, the toilet seat covered in fake fur. Fallaci slung the body over a bath that was made of white marble.

‘Christ, he’s heavy,’ he said.

Wilson didn’t respond, his gaze curious, academic, as Fallaci took a short rope from his pocket and tied it around the steel curtain rail. Then he made a short noose. ‘You’ll have to help me,’ he said. Wilson stepped in and tugged at the corpse, his arms under its armpits. Together they lifted the body up, its lifeless arms around their shoulders, raised it until its feet were off the floor, the head under the noose. ‘Hold him there,’ Fallaci said. He stepped back and turned around. He opened the noose and slipped it over the dead man’s head and then tightened the knot. ‘That’s it,’ he said. Wilson let go of the corpse. The dead man dropped down abruptly, then stopped, spinning slightly, his head jerked up by the rope, his neck stretched, the face bloating, slippered feet dangling just above the tiled floor, swinging gently from left to right. ‘Suicide,’ Fallaci said. ‘He reached the end of his tether.’ He picked up a small stool and set it on its side just in front of the dead man’s swinging feet. Then he straightened up, grinning. ‘Okay, sir?’

‘Okay.’
They left the bathroom and closed the door, went back into the main room, and stood there, glancing around in a casual manner, intrigued by the decor. The colors were garish, the furniture a bizarre mixture of styles, imitations of late-Renaissance and Victoriana and Art Nouveau, an elaborate chandelier fixed to the ceiling, intricate mouldings, bad paintings. Wilson sat in a chair, his azure gaze calm but remote, as if focused elsewhere. He looked up at Fallaci, saw him standing at the windows, framed by the rippling green of Biscayne Bay and the sky’s dazzling white haze.
‘I hope he’s punctual,’ Wilson said.
‘He should be here any minute.’
‘And you’re sure he’s never met that McKinley?’
‘It was all arranged by phone.’
Wilson checked his gold cuff links, crossed his legs the other way. ‘What about my voice?’ he asked coldly. ‘He might notice the difference.’
‘No, sir,’ Fallaci said. He started wandering about the room. ‘The arrangement was made through a third party. Your voice won’t mean a thing to him.’
Wilson glanced at his wristwatch. ‘We were informed that he was punctual.’
‘That checks,’ Fallaci said. ‘He’s a punctual man. That doorbell should ring any second now.’
The bell rang a minute later. Wilson got to his feet. Fallaci looked at him, nodded, went to the door, opened it and took a step back and said, ‘Can I help you?’
‘I’m Professor Vale,’ a man said. ‘Are you Mr McKinley?’ ‘No, sir. I’m his secretary.’
Fallaci stepped aside and Vale entered the room, a slim man, quite short, beard and hair flecked with gray, wearing white pants and a colorful flowered shirt, a tennis racquet held in his right hand. ‘McKinley?’ he asked.
‘Yes,’ Wilson said. ‘Hello.’ He stepped forward and shook Professor Vale’s hand. ‘I’m glad you could come.’
Professor Vale smiled frostily. He seemed young for his fifty years. ‘Your man was very persuasive,’ he said. ‘If a little oblique.’ Wilson returned the smile. ‘Yes,’ he said. ‘I’m sure he was. But I’m also sure that you’ll understand our discretion when we finish our talk.’ He nodded at the bar. ‘Would you like a drink, Professor?’ Vale wiped sweat from his brow and

said, ‘Yes, thanks. Rum and coke. Lots of ice.’
Wilson nodded at Fallaci. ‘A white wine for me,’ he said. Fallaci went to the bar as Wilson pointed to a chair and said, ‘Take a seat, Professor. Relax.’ He indicated the tennis racquet in Vale’s right hand. ‘Did you have a good game?’
‘Pretty good,’ Vale said.
He grinned and sat down, placing his tennis racquet on the table, stretching his legs and wiping the sweat from his forehead with a folded white handkerchief. ‘It kills me,’ he said. ‘I don’t know why I do it.’ He patted his stomach and said, ‘I’ve got to keep this down. An academic’s obsession.’
Wilson smiled at the self-mockery. Fallaci brought them their drinks. Wilson sat facing Vale while Fallaci retreated to stand behind the bar and sip at the drink he had made for himself. ‘You play often?’ Wilson asked.
‘Only on vacation,’ Vale said. ‘I don’t like vacations all that much, so it helps pass the time.’ He drank his rum and coke with relish, wiped his lips with the back of his free hand, then sighed and stared steadily at Wilson, sizing him up. ‘All right,’ he said eventually. ‘What do you want, Mr McKinley? Your man said it was an offer of work, and right now that interests me.’
‘Just how much did my man tell you?’ Wilson asked.
‘He told me that you represented a European-based commercial company dealing in electronics, aerospace technology, communication satellites and assorted areas of high-energy research. He also said that you had produced components for ASAT warheads and European and American ICBMs. He said, further, that you were under contract to NASA for the production of various rocket components, but that you were intending to expand dramatically. Finally, he said that you were desperately in need of civilian scientists and technicians with experience in aerospace technology, and were willing to pay well for their talents. He said no more than that.’
Wilson smiled. ‘He was told to be brief.’
‘He was,’ Vale said. ‘Far *too* brief. But I’m interested.’ Wilson smiled again and put his chin in his hands, his elbows resting lightly on his knees, on his immaculate pants.
‘Well, Professor Vale, your information is essentially correct. I represent Air Communications and Satellite Systems, better known as ACASS, a Frankfurt-based, internationally financed company that specializes in the production of advanced electronic communications packages and spy

satellite components under contract to European and US government defense establishments.'
'I know about ACASS,' Vale said. 'I've often used your components.'
'Yes,' Wilson said, 'that stands to reason. You've worked in the past for the USAF Space and Missiles System Organization in San Dierga, California; for the Linear Accelerator Center of Stanford University; and for the Lawrence Livermore Laboratory near San Francisco. You are, at the moment, an Advanced Space Programs Coordinator at the top secret Aerospace Defence Command Cheyenne Mountain Complex in Colorado Springs, Colorado. At these various posts you have specialized in research into advanced advanced ICBMs and anti-satellite weapons, and you're presently engaged in research into high energy laser beams and particle beam weapons, with particular interest in the Semipalatinsk plant in Russia… Given this, you would have certainly used our components. Now we'd like to use you.' Professor Vale could not help grinning. He glanced at Fallaci. The latter took his half-empty glass and topped up the rum and then handed it back to him.
'You've certainly done your homework,' Vale said.
'Yes. We're efficient.'
Vale smiled again at Wilson, his eyes glinting above his glass. He sipped his rum and then sat back in the chair, his boyish face thoughtful. 'I'm under contract to USAF,' he said.
'That contract ends in two months.'
'Okay,' Vale said. 'Talk.'
Wilson leaned forward, smiling, amused just a little, thinking first of Vale's understandable human vanity, thinking next of the man hanging in the bathroom, his neck snapped where the rope would undoubtedly scar it. Another suicide. Naturally.
'Professor Vale,' he said, 'we need men like you because we are, as you rightly said, expanding dramatically. Put simply, ACASS is planning to set up an overseas satellite launching base that will break the superpowers monopoly of space by launching spy satellites for any Third World country will to pay what we ask. At the moment this capability is available only to America and the USSR, so there is, as we see it, an open market for the sale of such satellites to any smaller developing country that's concerned with protecting its borders and wants a sophisticated early-warning system at a reasonable price. We can fill that need. We can construct simple, efficient

rockets. We can launch those rockets for anyone who pays and there are plenty of customers.'
'No doubt you'll have plenty of customers, but where will your base be?'
'A certain Third World despot in Africa has leased us approximately one hundred thousand square kilometers of his country in return from a rent of fifty million dollars a year to be paid in local currency after our first commercial launch, which will be five years from now. Given that this country's inflation is running at about eightyfive percent a year, the payment will be relatively negligible by the time it is due. We have also offered to launch a satellite free of charge, but on the condition that the so-called President pays for the actual production of the rocket. In short, what we've been given by this black lunatic, virtually for free, is one hundred thousand square kilometers of territory, total autonomy over that territory, full immunity from any prosecution by the state, full control over who is allowed to remain in the territory, and absolute disciplinary control over all natives within our designated area.'
'That's insane,' Professor Vale said.
'That's a fact,' Wilson said. 'That's the deal that was worked out between ACASS and the so-called President in Africa, and the contract has been signed, sealed and delivered. Photocopies of the contract are on my boat and await your inspection.'
Vale studied Wilson carefully, tapping his teeth with his glass, obviously startled by what he had heard, just as clearly intrigued. 'You can't build a rocket that cheap,' he said.
'Yes,' Wilson responded promptly, 'we can. The basic idea for the rocket came from some German scientists who originally worked on the V-2 rocket for the Nazis. After the war, one of those scientists went to Egypt to design rockets for President Nasser, retired to Austria, and then came to ACASS. Another came to the United States with Wernher von Braun, became an American citizen and leading light of the Kennedy Space Center, retired three years ago and has since worked for ACASS. The ACASS rocket is very much like a model the Nazis were perfecting when the war ended: easy to build, cheap, but efficient. Its basic unit consists of a tube filled with an oxidizing agent and another filled with diesel fuel; when these liquids combine they ignite and the rocket takes off. Also, instead of mounting rocket stages on top of one another, the ACASS rocket is simply a large bundle of standard units: the greater the load, the more units you

include. It is, in short, a massproduced rocket, fully functional and operative.'
'I want to see the plans.'
'You can see them. They, also, are on my boat.'
Vale sat back in his chair, tapping his glass against his teeth, studying Wilson and then gazing around the room, taking it all in. Wilson sat there, saying nothing, thinking of the dead man in the bathroom, thinking also of what would happen to the world if ACASS had their way. Would the idiocy never cease? Could the fantastical be controlled? Wilson thought of the dead man, of the commercial company he had represented, of the many scientists who would take on any kind of work so long as the price was right. Professor Vale would not be one of them. Professor Vale would not be paid. The good professor, with his vanity and greed, would be put to use elsewhere. 'I'm interested,' Vale said, 'but I want to see some documentation. I want to see all your contracts, I want to study the rocket designs, and after that, if I'm satisfied that you're legit, I might discuss my own terms.'
'Excellent,' Wilson said. 'I'm sure you'll find them impressive. They're all in the safe in my boat. Could you go there right now?' 'Now?'
'Why not?' Wilson said. 'You're only here on vacation, you said yourself that you were bored, so let's go to my boat, take a trip, some food and wine, and you can study the documentation at your leisure, then go home and decide.'
'I don't know…' Vale began, hesitating.
'Is your wife here with you?' Wilson asked.
'Yes.'
'Then why don't we collect her and take her along with you? I'm sure she'll enjoy being on the boat.'
That was enough for the good professor. 'I think I'll go on my own,' he said. 'I mean, I don't want her hanging around when we're discussing business. What the hell, let's just go.' He finished his drink and stood up, licked his lips and nodded affirmatively, then want to the bar, passing Fallaci, and set his glass down. 'Where's your boat docked?' he asked.
'Another drink?' Fallaci said.
'No, thanks,' Vale replied.
'Pompano Beach Marina,' Wilson said. 'We can be there in less than an hour.'

‘You have a john?’ Professor Vale asked. Fallaci touched his elbow lightly. ‘Yes, sir,’ Fallaci said. ‘That door there. At the far end of the room. The first door on your left.’ Vale thanked him and walked away, turning into the second bathroom. Fallaci then looked at Wilson, grinning nervously. ‘That was close,’ Wilson said.

They all left shortly after, left the dead McKinley dangling, closed the door and went down in the elevator and walked out through the lobby. The sudden brightness was dazzling, beating off the white walls, off tall buildings and sidewalks and streets, the sea beyond the palm trees. Fallaci walked on ahead. He led them into a parking lot. Wilson sat in the rear of the car, talking casually to Professor Vale, as Fallaci drove into Collins Avenue, his eyes fixed on the busy road.

Professor Vale was loquacious. The two rums had affected him. He kept looking out the window, at the hotels and condominiums, at the surfers and well-dressed passers-by, at the bored wives and gaudilydressed whores and the packed, noisy sands. Miami Beach glided past them.

‘You know Miami, Mr McKinley?’

‘Not really,’ Wilson replied. ‘I used to have my boat docked in Norfolk; I only came here this year.’

‘You picked the wrong year,’ Vale said. ‘This is the year of the pig. I’ve been coming to this place for fifteen years, but it’s not what it used to be. Cubans and blacks, homosexuals and hookers; you get these kids from the University of Miami and they’re wrecking the place. I mean, I’ve had it up to here. You wouldn’t believe what goes on. I’m a white, Anglo-Saxon American and I don’t mind admitting it. But take a good look around you. What do you see? Drive through 79th Street or Biscayne Boulevard or Kennedy Park; you’ll get a blowjob in the front seat of your car before you know where your billfold’s gone. I mean, these hookers are everywhere. They own Lincolns and Cadillacs. You just go into the Boom-Boom Room or the Poodle Lounge in the Fontainebleau and you’ll see them shaking their tails for all they’re worth, picking up on the tourists. Either that or it’s the fags, from Coconut Grove to Fort Lauderdale: they have it organized so well that the 21st Street sea wall is no longer the place to go for a broad – the fags have cleared out the area. The future America is in Miami; the Brave New World is around the corner: prostitution, male and female, a lot of porno movie houses, filthy habits and VD and drugs and organized crime. That’s Miami, Mr McKinley. It’s the world delivered by science. I

look around me and I wonder what it means and then I look to the future. Fuck America, I say. What's America given me? It's given me radicals and communists and anarchists and degenerates, and it's offering me Miami and Las Vegas and cesspits like New York. Fuck America. Who needs it?'
Vale shook his and chuckled, short and slim, almost boyish, his bearded face now showing his fifty years, the lines good-humoured and youthful. Wilson glanced at him, sardonically amused, and just then the car came to a halt.
'Here we are,' Wilson said.
They left the cool of the car for the blinding light of the marina, squinting and then stretching themselves, adjusting to the tropical heat. Fallaci led them to the boat, a neat Italian, moving fluidly, his eyes darting left and right, their soft brown hiding ice, double-checking everyone in sight, every movement that could indicate trouble. Bronzed girls in bikinis, blond youths in tight shorts, gawking tourists and surfers and lifeguards: Fallaci watched them all carefully. The sky was a dazzling haze, the water went from blue to green, and the boats in the harbour, all shapes and sizes, reflected sunlight from chrome and polished wood, their colored sails flapping rhythmically.
Professor Vale was impressed. He was particularly impressed by the boat they stopped at. A high-powered luxury cruiser, about sixty feet long, it had the look of a floating penthouse and was clearly a rich man's toy. Fallaci led them up the gangplank, onto the polished, gleaming deck, and a servant wearing an immaculate starched white jacket stepped forward and bowed to them. Wilson followed them aboard, his gelid gaze scanning everything, then he waved to the door directly facing them and said, 'In there, Professor.'
Vale glanced around him, at the blue sky and green-blue sea, and said, 'If you don't mind, I'd prefer to remain outdoors and pretend that I'm healthy.'
Wilson smiled understandingly. 'That's fine with me,' he said. 'We'll just take the boat out a few miles before commencing our business. We can talk over lunch.'
The waiter stepped forward again, bowing slightly to Vale. He had dark skin and Oriental eyes, his face curiously smooth and unlined. 'A drink, sir?'
'Rum and coke.'
'White rum?'
'No, dark.'

The waiter bowed again and then retreated, back in through the nearest cabin door.
‘Where does he come from?’ Vale asked.
‘Hawaii,’ Wilson lied.
‘For a moment there I thought he was Korean, but then he seemed a bit different… Hawaii… should have known.’ Vale shrugged and rolled his eyes, grinning at Wilson and turned away, looking over the other boats, the pristine white walls of the marina, the shimmering haze above the horizon where the sky met the sea. ‘This is some boat,’ he said.
‘Thank you,’ Wilson said.
‘If you meant to impress me, you’ve succeeded.’ ‘Good,’ Wilson said. ‘We like to please. It’s all part of the service.’
The waiter returned with two drinks on a tray while Fallaci, who had been standing near the cabin, disappeared through the door. Wilson and Vale took their drinks, the waiter bowed and departed, then Vale leaned against the brass railing and stared around him with interest. The boat had a large crew, all dressed in white, all busy at their various tasks, working methodically, silently. There was something strange about them. Vale didn’t know what it was. They were all small and slim, dark-skinned, with narrow eyes, and Vale found himself refusing to accept that they came from Hawaii. He watched them with interest. They made him feel a bit unreal. They never glanced at one another, never spoke, and they kept their heads down. Vale shivered a little. He felt decidedly odd. He drank some rum and grinned at Wilson, still not knowing who he was, then the boat’s engine rumbled and the boat moved slowly out of the harbour.
‘Where are we going?’ Vale asked.
Wilson shrugged. ‘Nowhere special. We’ll just go out a short distance, maybe ten or fifteen miles, and then anchor. We’ll have lunch and then you can study all the documentation.’
The boat cruised out of the harbour, past white-painted buildings and other boats, the palmettos casting shadows on the people wandering lazily back and forth. The marina gradually fell behind them, revealing the immense sweep of the coastline, yellow beaches dominated by condominiums and baroque hotels. Eventually there was only the sea, green and blue, reflecting sunlight, waves rippling in pearly lines around the boat and streaming out in their wake.
‘Beautiful, isn’t it?’ Wilson said.

‘Yes, it is,’ Vale responded. ‘But I’ve always felt slightly weird out here. You can’t ignore all the stories.’
‘Of course… the Bermuda Triangle.’
‘You sound sceptical,’ Vale said.
‘Oh, I’m not completely sceptical. When so many boats and planes disappear, one can’t help being curious.’
‘Right,’ Vale said. ‘You simply can’t ignore the facts. Sinking boats you can accept. Crashing planes you accept. But other events have never been explained, and they make your flesh creep. What I mean is, I’m a scientist. I try not to believe in magic. But cases like that… I don’t know… We still don’t have the answers.’
‘What about UFOs?’ Wilson asked.
‘What about them, Mr McKinley? I won’t buy it that UFOs are the problem, here or anywhere else. I draw the line at flying saucers. The proof for UFOs is negligible. I’ll believe they exist when I see one… and I don’t think I’ll see one.’
‘Really?’ Wilson said, sipping his wine and smiling thinly, gazing over the railing at the sea, at the cloudy horizon. ‘I thought you might have seen one over the Cheyenne Mountain Complex.’
‘Why should I see one there?’
‘Oh, I don’t know…’ Wilson gazed at the clouds on the horizon, coming closer, expanding… ‘It’s just that I’d heard UFOs were frequently observed over scientific and military establishments. Given that, I thought they might have been seen over the Aerospace Defense Command.’
‘Balls,’ Vale said. ‘Anyway, the Cheyenne Mountain Complex has been built to survive a nuclear war – no matter how destructive – and as such can’t be seen from the air. In fact, that complex is a complete underground city, existing deep inside the mountain, resting on giant shock absorbers, webbed with miles of underground tunnels, and completely sealed off from the outer world. Believe me, McKinley, when you work in that place you’re not able to see *anything* in the sky – you don’t see a damned thing. Our job is to track spy satellites. Those are all we’ve ever tracked. Neither the radar nor the telescopes have ever picked up anything else. UFOs just don’t exist.’
Wilson smiled and sipped his wine, let the cool breeze fan his face, kept his gaze fixed on the sea, on the clouds near the horizon, that horizon which forever receded and led out to Bermuda. This boat would not reach

Bermuda. It would drop anchor and then wait. The good professor, in an intoxicated dream, would find that facts have no credence.
‘I don’t believe it,’ Vale said.
‘What?’ Wilson asked.
‘Spy satellites being sold in the marketplace. That’s just fucking incredible.’
Wilson didn’t respond. He watched the land disappearing. The sea was calm and the sky was a silvery-blue sheet, with white clouds drifting under it. Professor Vale continued talking. He seemed unsteady on his feet. He sipped his drink and repeatedly blinked as he glanced vaguely around him. Wilson listened attentively. The professor was talking about pulse-power weapons. The boat stopped moving and the anchor was lowered and the professor kept talking. The crew took up their positions. Fallaci returned to the deck. The sea washed around the boat, rolled away to the horizon, and Wilson smiled when he saw a dark mass spreading out just below them. Professor Vale kept talking. He suddenly seemed very drunk. Jets of steam were rising from the sea and forming into a cloud. This cloud surrounded the boat.
‘We didn’t invent the pulse-power beam. The Russians didn’t invent it either. The British invented it eighteen years ago, but kept it under tight wraps. Now we’re expanding its potential. We’re running a race with the Russians. We’re utilizing it as a defensive weapon, for communications and reconnaissance, and we’re making quantum leaps in our technology, quietly forging ahead. These laser beams are amazing. Their possibilities are limitless. They can knock out spy satellites, zero in on flying rockets, and even show up the number plates of cars from two hundred miles up – they can pinpoint just about anything. Think of what that means, McKinley. The Cold War has been superseded. What we now have is a Balance of Terror in a post-nuclear age. People don’t know what’s happening.’
Wilson didn’t reply. The silence rang in Vale’s ears. He shook his head and saw the shifting of the clouds, a silvery haze all around him. He didn’t know what was happening. He felt very peculiar. Abruptly, sweeping away his drunken ebullience, he felt a fierce, senseless dread. What the hell was going on? He felt sick and disorientated. His throat went dry and his eyes went out of focus and the deck seemed to tilt. Vale dropped his glass. He watched it falling to the sea. It took a long time going down, turning over, reflecting sunlight, the light flashing off it in dazzling striations of incredible beauty. He didn’t see it strike the water. The hot air was beating

at him. He looked sideways at McKinley – McKinley? – and saw icy blue eyes and gray hair. Not gray hair: silvery. Not silvery: a shimmering white. He was here, Professor Vale, I am here to make a deal with McKinley. Then fear. The inexplicable. The white hair and azure eyes. Professor Vale tore himself from this vision and glanced wildly about him. The boat was silent and still. The sea was boiling up around it… Roaring and boiling up around them all in immense walls of green steam. 'Jesus Christ! What the hell…?' Vale grabbed hold of the railing, the deck shuddering beneath his feet. The huge clouds of steam were rising from the sea and surrounding the boat. Vale couldn't believe his eyes. The clouds of steam blocked out the sky. They had formed a perfect circle around the boat, half a mile in diameter. Now Vale wanted to scream. The deck shuddered again and groaned. Vale looked over the railing, down the side of the boat, and saw an immense, dark mass just below the surface, spreading out, slowly rising.

'The Triangle! Oh, Jesus…!'

Vale slapped his forehead with one hand, terror sweeping away his senses, glanced around and saw McKinley, azure eyes and white hair, saw the crew, the Orientals, coming toward him, small and slim, moving silently. He tried to run, but it was hopeless. Where could he run to? Paralyzed with fear, he gripped the railing, trying to take in the nightmare.

'Oh, fuck! *Oh my God*!'

Suddenly, the sea roared. He stared at the distant clouds. Now much closer, they boiled up from from the waves to form a wall that blocked out the whole sky. Then the spiraling waves exploded, the spray sweeping around glinting steel. A perimeter of spikes surfaced, faraway, beneath the steam, all triangular, splitting the water like metal fins, thrusting up, growing larger.

Vale heard the sound of his own blubbering, saw the white ridge of his knuckles, his rational self stunned by disbelief and a throttling terror. All that and something else: an unreality that drained his senses. His head was spinning and he recalled the falling glass and realized he was drugged.

He tried to focus on McKinley, wondered who he really was, saw his icy blue eyes and white hair, the wall of clouds beyond him. The boat was trapped inside those clouds. The green steam swirled and drifted. The triangular grids rose from the sea, growing larger, spitting water, a great circle of gleaming steel teeth that surrounded the boat. Vale couldn't believe what he was seeing. The only reality was his fear. The deck shuddered

beneath his feet, the boat rocking and rumbling, and he glanced down and saw an enormous mass rising to the surface.

'*Grip the railing*! *Hold tight*!'

Someone was shouting at him. He licked his lips and saw McKinley. The azure eyes were uncommonly bright and intense, hypnotizing him, chilling him. Be he did as he was told. He saw the wall of steel around him. He felt the presence of the massed crew behind him, but he didn't dare look at them.

The monster's steel jaws were closing. Vale's eyes were drawn to the boiling sea. The dark mass was still rising and spreading out, and then it struck the boat's hull. Vale felt it and heard it: the deck shuddered and shrieked. There was a harsh, metallic rumbling, water rushing and hissing, then the boat suddenly rocked from side to side, settled down, finally steadied.

Vale looked on, mesmerized. The whole boat was slowly rising. The sea poured away between the rising walls, and an enormous steel deck broke the surface. This steel deck was smooth and solid, a quarter mile in diameter, and the walls that had looked like huge fins went right around its perimeter. The sea poured out through those walls, the enormous deck pushed the boat up, and the triangular fins of the perimeters started moving toward one another, rising high and curving in above the boat like interlocking, giant fingers.

Vale gazed up in awe. The steel walls curved high above him. They were roaring and hissing, water rushing down their sides, and they moved in toward one another to block out the steaming green clouds. Vale stood there, paralyzed. The deck was steady beneath his feet. The triangular walls came together high above to form an immense, empty hangar.

The walls locked together, reverberating. A bright light filled the gloom. Vale looked across that great floor of steel and saw nothing but curved walls. Then the floor began to rumble. Vale almost gagged with fear. The floor began to sink, like some enormous elevator, and the walls soared all around him, an immense globe of steel, until the light became a blazing white haze that turned the dream into reality. Sweeping vistas of steel and glass. A maze of ladders and catwalks. Silhouettes moving through the white haze, the air vibrating and humming. Vale saw it and felt awe and choking horror. Something cold touched his neck and then scorched it and he dropped into Hell.

Chapter Seven

Richard was standing before the large windows of the front room of the apartment, a glass of cheap red wine in his shaking right hand, his eyes bloodshot and blinking, slightly glazed with constant fear, looking over an adventure playground, the grimy rooftops of Finsbury Park, the gray sky that seemed to smother the distant maze of the City of London. The sky obsessed him, mesmerized him, filled him with dread and fascination, glided through his dreams and colored his waking hours with the promise of more horrors. It was six in the evening, darkness advanced across the skyline, and Richard raised his glass of wine to his lips to drink deeply, compulsively.

All white. Everything. He closed his eyes and relived the nightmare. His hand shook as he had another sip of wine and then opened his eyes again. He saw the labyrinth of the city, the distant dome of St. Paul's, and above it, the darkening, cloud-filled sky that took him back to the start of it.

Richard shivered violently, finished his drink and turned away, then he left the room and entered the kitchen and poured some more wine. He had a sip and then glanced around him, at empty bottles and unwashed dishes, crumpled newspapers on the table, on the floor, the signs of total neglect. He had been here for five days and had only gone out for the papers. He couldn't eat, he couldn't sleep, he rarely washed, and the wine helped to make the long days pass.

He left the kitchen, stood briefly in the hallway, drank more wine and stared at each of the rooms in turn, at the comforting brightness. Every light in the apartment was turned on. They had been on since he arrived here. He didn't dare turn them off lest the nightmares returned and jerked him out his restless sleep, screaming dementedly, his thoughts haunted by phantoms.

All white. Everything. He couldn't believe what had happened. He could believe even less that he had awakened three days later, alone, on the hills of Dartmoor, thirty miles from Bodmin Moor, the drunken woman and her car no longer there, the missing days a mystery. Richard shuddered again at

the very thought of it, put the glass to his lips, drank deeply, and went back to the lounge, wishing that Jenny would come.

He had phoned her an hour ago, the first call since his return, and had noticed the confusion in her voice, the hint of anger beneath it. In truth he couldn't blame her; more precisely, he didn't care; now driven by the singular, desperate need to talk it out of his system.

All white. Everything. His last memory was of the whiteness. He recalled the flying disks, the enormous mother ship, the silhouettes moving to and fro in the dazzling light – then nothing: oblivion. A nauseous awakening on Dartmoor; stumbling down the hill and hitching a lift and being told by the driver that it was Sunday. He hadn't understood that at all – his last recollection was of Thursday – and sitting there in the truck beside the farmer he had thought he was going mad.

Now he stood by the window, drinking wine, shaking in spasms, rubbing his unshaven chin and looking out as the city's lights blinked on. The lights were floating in darkness, a silvery web, a sparkling mosaic, and they merged with the lights in his head and took shape as the nightmare…

His feverish thoughts had filled the nights, making him pace from room to room through the apartment, trying to shake off his demons. The fear was always present, all around him, deep inside him, a living thing that breathed against his neck and made him drink even more. Exhausted, terrified, he dreaded sleep, yet had to sleep, sitting upright in a chair, groping blindly for the bottle, muttering vague and incoherent protestations as the silence tormented him.

Richard couldn't understand it, couldn't touch it or see it. What it was, what it meant or might mean was something concealed from him. So he drank and relived it. He wondered constantly about the woman. He saw that enormous flashing mass, the flying disks, the jolting car; and he sobbed as the white light flared up and sent him into oblivion.

It had started five days ago. He had paced the apartment all that time. The world outside, both by day and by night, now seemed alien and threatening. Richard thought about reality. He wondered what reality was. He was

pondering this riddle, losing himself in labyrinths, when the shrill ringing of the doorbell cut through him and made his nerves twitch.

‘Jesus Christ!’ he whispered.

Turning away from the window, he stepped forward, then stopped, had another sip of wine and licked his lips and let his nerves settle down. It was all too much for him: at eighteen he felt like fifty. He glanced around the cluttered room, at the squalor of his hibernation, and he felt the shame reaching up to stroke him and make his cheeks burn. Then he licked his lips again, shook his head and stepped forward, leaving the room and going along the straight hall, the lights stinging his eyes.

The front door had stained-glass windows, pretty mosaics of lead and wire, and he saw her silhouette at the other side, an indistinct, smokey form. He froze there, frightened again, the fear followed by further shame, wondering if it really was her, wondering why he should doubt it. Then he shook his head from side to side, cursing softly, trying to grin, but the grin died pathetically on his lips when the bell rang a second time.

‘Jenny?’

‘Yes! What’s the matter? Let me in! Why in God’s name are you whispering like that? What on earth’s going on in there?’
Richard unlocked the door, fumbling clumsily, nervously, then stepped back and pulled the door open and studied her carefully. Jenny didn’t step inside, simply stared at him, shocked, her right hand reaching up to her forehead, brushing her auburn hair from brown eyes.
‘What on earth…?’
‘Come in.’
‘*What*?’
‘I said come in.’
‘What on earth have you been doing to yourself?’
‘Don’t just stand there. *Come in*!’
She stared at him, brow furrowed, a forefinger to her lips, then she shrugged and stepped reluctantly inside, her shoulder brushing against him. This brief contact was electrifying, jolting through him as a shock – not sexual; more a sudden awareness of being outside himself. He closed

the door and turned around, saw chocolate-colored eyes, a moonshaped face, her auburn hair a tangled web of curls, her long legs in blue denims. She returned his gaze, studying him, then shrugged and moved away, wandering lazily along the hallway, glancing into all the rooms, sighing despairingly when she saw the awful mess: the empty, discarded bottles.
‘Very nice,’ she said mockingly.
Turning back, she stared at him, a quiet appraisal, clearly critical, then she shrugged and entered the living room and he dutifully followed her. Stopping again in the middle of the room, she surveyed the untidy mess on all sides, then she sighed and sank into an armchair, her legs languidly outstretched. She was clearly disgusted.
‘I don’t believe this,’ she said.
Richard didn’t reply. He simply raised his glass and drank. Then he went to the windows and looked out to see the lights of the city. The whole of London was ablaze, the individual lights seeming to join together in darkness, and as they merged, they fused together in his thoughts, making him turn away, shivering. Jenny sat back in her chair, her shabby parka across her lap, her legs still outstretched, attractively long and slim, lethargically mocking him.
‘Five days,’ she said. ‘You said you’ve been here for five days. I didn’t really believe it when you told me, but now I’m convinced.’ She raised both her hands, indicating the squalid room, then the hands dropped to rest on one another as her gaze took him in again. ‘You and the apartment look the same,’ she said. ‘You both look fucking terrible.’
Richard tried to grin and failed; instead, feeling embarrassed, he looked around him before slowly, reluctantly, returning his gaze to Jenny, wondering what he could say to her.
‘It’s a mess all right,’ he said.
‘Yes,’ she said, ‘a bloody mess. What the hell have you been doing all this time. Having an orgy?’
This time Richard managed a grin, a weak offering, not his usual, then his blue gaze, which once had been candid, slid furtively sideways.
‘What are you looking at?’ Jenny asked.
‘Nothing,’ Richard replied.
‘Take a good look,’ Jenny said. ‘It’s worth studying. I’ve never seen the place like this before.’ Her eyes were bright with anger, flecked with steel, wondering over the littered armchairs, the stained settee, the cluttered

tables, the bottles dropped carelessly to the floor, the newspapers and magazines. ‘You only got this apartment so cheap,’ she reminded him, ‘because my friend is still holding the lease, Now it’s not a great apartment, but it *is* pretty good, and I don’t think you’ll impress her too much by turning it into a pigsty.’

Richard finished off his glass of wine, shuddered again and turned away, picked a half-empty bottle off the table and filled his glass and then had another sip.

‘Don’t offer me a drink,’ Jenny said. ‘The sight of you has already put me off it.’

‘Sorry. I didn’t think. You want one?’

‘No.’ Jenny smiled bleakly, not removing her steady gaze from his face. ‘Even your parents think you’re still down in Cornwall. What the hell’s going on?’

Turning away, Richard went to the windows, and stood there for some time, looking out, a man lost in his thoughts.

‘I don’t know,’ he said eventually. ‘It seems crazy. I don’t think you’ll believe me.’

‘Try me.’

He turned back to face her, his eyes bloodshot, remote, the light shining on the wine in his glass, the glass visibly shaking.

‘All right,’ he said. ‘I didn’t get to St. Ives. Something happened on the way to St. Ives that I just can’t explain. You’ll probably think I’ve gone mad.’

‘And have you?’

‘What?’

‘Gone mad.’

‘I don’t know. I’m not sure.’

He shivered again, his gaze slipping furtively sideways, finding the ghost of himself in the squalor, his distraught other half. Then he told her his story, talking hurriedly, almost frantically, pacing to and fro, his hands shaking, spilling wine, running nervous fingers through his uncombed hair, his eyes avoiding her face. Surprisingly, it was now easy to tell the tale – more than easy: a burning necessity – and as he listened to his own voice, as the words came tumbling out, he felt that he was coming apart, losing his old, protected self, changing into someone wiser, less assured, aware of life’s hidden mysteries…

‘That was near King Arthur’s Hall. King Arthur’s Hall is on Bodmin Moor.

The last thing I remembered was the blinding white light and those silhouetted figures… Like a dream, a kind of wide-awake vision, not real; and I screamed and then heard myself groaning and had nightmares and woke up… Inexplicably, I was back in Dartmoor.'

He was silent for a moment, as if questioning himself, doubting his own words, then he said, 'Can you imagine the feeling? I was dazed and scared shitless. It was cold, but I was burning all over – my hands were burnt red. I mean, I couldn't accept it. I didn't know what had happened. I walked down the road, hitched a lift with a local, and when I tried to tell *him* what had happened, he clearly thought I was crazy…'

He tapered off and sucked his breath in, then let it out in a loud sigh. 'I caught a train and came back here. I saw my burnt face in the mirror. That made me feel even more frightened and I started drinking to keep the fear at bay. I didn't know what I should do. I didn't want to tell anyone. The drinking didn't kill the fear and the fear was something else, something living inside me. What I mean is, it seemed *real*. It seemed to be a living presence. I could feel it there beside me, right behind me, something tangible, *physical*… Then I thought about the woman. What had happened to her? She was real, had to be – we spent hours in her car – then both of us, inside the car, were drawn into that spaceship?'

He sucked his breath in again, let it out in another sigh. 'Spaceship? I don't know. I know that sounds crazy… But something – something enormous – came down and opened up and then swallowed us… Unbelievable. Ridiculous. I still can't grasp that it happened. I can't believe it, yet it had to be real… It just had to be; *had* to be.

'So, I stayed here. I had real problems sleeping. I forced myself out every morning, but I couldn't stay out long. I kept imagining things. I always felt I was being followed. I'd come back to the apartment and start drinking again and hear the walls creaking. I was terrified of sleeping. At night, I'd fall asleep anyway. I dreamed that they were coming to get me, but they never materialized.

'I wanted to call you, call my parents or the police, but every time my hand reached for the phone the fear would come back in spades. I think it's going away now. It's still here, but not so bad. I think the booze is finally burning out the fear – maybe just because you're here – but I still feel uneasy. What happened out there? What happened to that woman? I awakened three days later on Dartmoor. I have to know where those days went…'

He stopped talking and blinked a few times, saw the light bulb above him, a dazzling sun, blinding him, making him melt down to his essence. He shook his head and licked his lips, glanced at Jenny, turned away, picked a bottle from the table and poured more wine, letting it splash on his wrist. He had a drink and gasped loudly, as if about to choke, then he shuddered and sank into a chair, facing Jenny's cold gaze.
'You're drunk,' she said.
'Jesus Christ, is that your answer?'
'You're drunk and you've been drinking for days and the drink is now talking.'
'I don't believe this,' Richard said.
'I'm not an idiot,' Jenny said. 'What the hell were you doing with that woman in a parked car at night?'
'*What*?'
'Your lady friend. Red hair and green eyes. You and some bitch in her car in the middle of Bodmin Moor.'
'Damn it, Jenny – '
'Bodmin Moor, my love? The middle of desolate Bodmin Moor? Do you really expect me to believe that this woman's car just broke down? Come *on*, love, pull the other leg.'
'It *didn't* break down,' Richard said. 'That huge flying saucer, or maybe the smaller saucers, made it cut out! Believe me, there was nothing wrong with the car. Those things killed its engine.'
'Oh, dear God, what a story!'
Richard's head began to swim, his hands shaking even more, as the logic of her feminine reasoning mocked his pitiful fears. Suddenly he was filled with mirth, an hysterical urge to laugh, bubbling up to his throat and sticking there, almost making him choke. It was just too ridiculous (could she really be jealous?) and he licked his dry lips and blinked repeatedly, trying to keep her in focus.
'Fuck you,' she said. 'That's why you've been drinking. You hitchhike to Cornwall, you get picked up by some tart, you both get drunk and then she makes you an offer that you simply can't refuse. God, you miserable bastard! What a puritan you must be! You had a bit on the side, a brief fling, and now you just can't admit it… But UFOs… Oh, Lord!'
She shook her head despairingly, rolled her eyes, crossed her long legs, then gazed around the room with studied interest, as if thinking of other things.

‘It was a UFO,’ Richard said. ‘A big UFO and smaller saucers.’
‘Filled with little green men, no doubt.’
‘Okay, Jenny, fuck it, just forget it. Go to hell. Go on home.’
‘You’re drunk.’
‘So I’m drunk.’
‘You should have tried to stay sober. At least sober you’d have thought of a decent story. Now you know what the wine can do.’
Richard stood up, swaying, the room spinning around him, then he steadied himself and went to the table and poured some more wine.
‘I’m going home,’ Jenny said.
Sighing, she stood up, walked across to the bookshelves, ran her finger through the dust, held it up and ostentatiously studied it. She was attractive standing there, slim and elegant in casual clothes, but he looked at her without feeling his former desire for her, only feeling removed from her. It was odd to feel that way. He felt no desire at all. He then realized that he had not thought once of sex during the whole nightmarish five days. Jenny’s presence had not changed that. He still felt sexually dead. He was ruled by his head, by the fear, and all else had been numbed in him. What *did* he feel? Nothing outside himself. He no longer felt anything but dread, his ever-present, cold terror. Jenny turned around to face him. She was tense and antagonistic: a pretty girl, someone from his past, with no place in his future… someone talking from faraway.
‘I don’t believe this,’ she said.
‘Neither do I’ Richard said.
‘Did you really think I’d fall for that story? Or is the drink just too much for you?’
Suddenly, Richard felt rage, an unreasonable, brutal hatred, recalling the woman in the car, the flying disks by the windows, the beams of light that shone into her eyes and turned her to stone, his own burnt hands and face… Then he stepped up to Jenny, jerked his shirt collar down, lowered his head and then pointed to his neck with a stained, shaking finger.
‘Look!’ he hissed. ‘*Damn you, look*!’
Jenny was startled by his vehemence, almost pushing him away, her delicate hands flapping loosely in the air and then cupping her face. She glanced briefly at his neck, her brow furrowed, eyes confused, when she saw the livid scar beneath his ear, running under his jawbone.
‘It’s a burn mark,’ she said.

‘Damned right, it’s a burn mark! They shot a beam of light into the car and that’s what it did to me.’
‘Oh, Richard, for God’s sake – ’
He let go of his collar and looked at her with wild eyes, his glass of wine spilling on the floor, further staining the carpet.
‘Fuck it, Jenny, it’s true! Those lights shone into the car. They hypnotized the woman, burned the side of my neck, and then, I swear to God, they did something to the car, took a hold of it somehow, pulled it forward, right into that mother ship. You explain it, Jenny! *You tell me*!’
He was shouting, flushed crimson, a demented gleam in his eyes, those blue eyes that normally were clear and filled with good humor. Jenny stared at him, transfixed, not quite frightened but nervous, seeing someone other than her familiar Richard, some stranger, a possibly threatening presence. At that moment it became too much to bear – the room’s squalor, his uncommon fury and possible dementia – so she pursed her lips and picked up her parka and tried to hide behind a wall of defiance.
‘I don’t *have* to explain it, Richard. I don’t believe it and I won’t listen. I don’t know why you’re acting this way and it has me bewildered. But you’re drunk. You’re talking crazy. I won’t accept this bloody nonsense. When you’re sober you can pick up the phone and give me a call. Now I’m going home.’
Richard stumbled toward her, his hand raised to hurl his glass, but he cracked his shin against the coffee table and dropped the glass and cursed loudly. Jenny stepped back, shocked, staring at him with big eyes, then she shook her head sadly from side to side and hurried out of the room. Richard followed her, enraged, but also shaken by his own violence. He raised his hand and shook his fist wildly as she opened the front door.
‘We’re asleep!’ he shouted after her. ‘*All* of us – we’re asleep! You listen to me, damn it, we’re asleep! We’ll all have to wake up soon!’
He hardly knew what he was shouting, didn’t listen, didn’t care, simply wanting to hear his own voice raging into her silence. The slamming door was his reply – slamming hard: a rebuke – and he cursed and turned back into the room, now horrified by his own performance and shaking even more.
What had happened with Jenny? What the hell had he done? Already the recollection was dreamlike, unreal, slipping out of his reach. The light bulb burned above him, unnaturally bright, mesmerizing, and he blinked and

rushed across the room to look down through the windows. He saw Jenny just below him, hurrying along the tarmac path, slinging her parka carelessly across her shoulders as she passed the parked cars. It was dark in the driveway, moonlight filtering through the trees, the fallen leaves drifting around her feet as he walked toward the broken gate. Then she was gone. She had not looked back once. Richard stood there, looking down at the empty darkness, letting the silence embalm him.

Fear. The inexplicable. Dread returned, creeping slyly. Richard found another glass on the table, poured more wine, started drinking. What the hell was he doing? He didn't normally drink this way. It was funny how quickly you got to needing it, how the fear made your throat go dry. Richard drank and paced the room, his hands shaking, gaze restless, seeing shadows, hearing whisperings in his head, sensing alien presences all around him.

Jenny had left. She had departed and he felt dead. This death was not in Jenny's departure, but in something much larger. He had died a week ago. The original Richard had disappeared. The new Richard, a haunted creature, sweaty with fear and confusion, was the matrix of something yet to be formed and prepared for an alien world.

Dread and disbelief. A past rendered obsolescent. He glanced up and saw the burning electric bulb, the rings of light surrounding it. All white. Everything. It had started and ended there. His former history, his structured life, his childish belief in an orderly world, had been shattered in the blinding white haze and would never return. He was sane or he was mad. If he was sane, the world was mad. The most fantastic possibilities now arose and left him feeling defenseless.

Richard went back to the windows, looked up at the stars, and was drawn to the vast sweep of the sky. It had happened: he had lived it. Now he understood his fear. It was the fear that it might happen again – or that it might not have happened. He couldn't separate the two. The two were one and the same. He dreaded learning what the experience might have meant, but feared his ignorance even more.

And what had he shouted at Jenny? What exactly had he meant? *We're all asleep*. *We'll all have to wake up soon*… What in God's name did *that* mean? Richard shook his head in wonder. He didn't know what he had meant… Perhaps a belief, possibly just a suspicion, that the fantastic was normal. His farewell. His defiance.

Richard shivered and turned back to face the room. The white telephone gleamed on the table and offered its challenge. Fear. The inexplicable. He couldn't do it: he couldn't talk. He thought of Jenny, of her reaction and her departure, and he knew what it meant. If he talked, they would surely think he was mad. No rational being would accept it. Richard trembled and then felt a great hunger that overrode his concern. He had to get out or collapse. He had to return to sanity. He felt spectral, asexual, drained of life, and he had to defeat that. Trembling again, he shook his head and placed his wine glass on the table. He glanced around the squalid room, heard the silence, felt the fear, then he reached out and picked up the telephone and dialed the police.
Someone spoke.
Faraway.

Chapter Eight

I retain my contempt. This one emotion is strength. I have needed that strength for many years and will not let it go. What age was I at the time? I think I must have been forty. I still believe it was the explosion over Russia that led to the troubles.

That was 1908. We made a simple mistake. We had a crude form of atomic propulsion and we couldn't control it. So, we had an explosion. The Tunguska region was devastated. The accident frightened the stock company in New York and that started the problem. Some executive panicked, his panic infected the US government, and they were frightened that the project would be exposed and reacted accordingly. They demanded control of our project. Talked of national security. They made a deal with the corporation in New York and placed us under the military.

The military mind is perverse. It destroys all it touches. Once the military took over our project, I knew it was doomed. An immediate conflict of interests. I presented my case and was rejected. I had dreamed of the Atomic Age, of exploration and research, but the military had only one aim, which was national defense. I knew what that meant: they wanted machines for future wars. And though despising them, I nevertheless worked with them to keep my plants open.

The following years were a nightmare. My contempt for the military deepened. A bottomless pit of paperwork, interdepartmental conflicts, interference of the most ignorant kind, then a cutback in funds. All governments are the same. They lumber along like dinosaurs. Shortsighted, unimaginative, existing only for the moment, they made demands and then cry in protest at the cost, thinking only of votes. Yes, I despise them. That emotion was a luxury. It burned within me all those years and gave me the strength to continue. My contempt lacked morality. But I have never believed in such. Morality, that conceit of free men, is no aid to their progress. So, not moral outrage. No, it wasn't that. My contempt was for the cowardice and ineptitude that hampered my work.

My sole interest was science. My major passion was flight. I was dreaming of a voyage to the stars and their infinite mysteries. This dream was not common. Those fools thought it was madness. I realized that they were draining my brain for their own pointless purposes. And so finally I revolted. Withheld vital information. Over two or three years I sabotaged my own projects, deliberately causing failure after failure, feeling pain for the first time.

Such anguish to endure. The first and last time I felt it. The knowledge that I was destroying my own work to keep it safe for the future. And for all that, I did it. My contempt was my protection. I now knew that the cost of the research had filled them with panic. My great machines would not be built: they would rot while the weapons grew. The men in charge were men moved by mortal fears: they lacked vision and courage. I did not need such men. Such men were a menace. Only heroes or madmen, History's undefiled dreamers, would be capable of backing my vision and making it real.

Thus I sabotaged the project. I said our hopes had been misguided. They stared at me from behind their long table and showed great relief. My apologies were accepted. A few murmured their regrets. Then my atomic propulsion project was aborted and the hangars closed down. World War 1 had already started. The Dark Ages had returned. They wanted aircraft of a functional nature, so I quietly resigned.

The worst years of my life. I was forty-five years old. My genius for technology kept me working, but frustration was choking me. Years of

drifting around the country. Work here, working there. Hiding my genius and displaying mere competence, thus avoiding attention. How did I survive it? With contempt. With willpower. Democracy, that catchphrase of the West, became something to laugh at. Democracy was incompetence. The right to vote meant poor leadership. What was needed in the world, and what I wanted most desperately, was a government of heroes or madmen who sought the impossible. Such a government did not exist. The US government was run by cowards. Thus for years, with a pain that turned to rage, I kept my dreams to myself.

Years of lacerating anguish. The first and last time. Sustained by relentless curiosity and indomitable will. My contempt for their blindness. My refusal to accept defeat. Every scientific library in the country falling under my scrutiny. All that, plus the work. The demeaning jobs I did for money. My genius for engineering, electronics and aeronautics offered up in the disguise of mere competence as a means of survival. But I used even that. Used laboratories and workshops. Created small things here and there, the minor offshoots of my genius, and sold them to the moguls in suits for the freedom I needed.

Then I found a resting place. The facilities were exceptional. I stayed with an aircraft company in Texas as the head of their research lab. All those nights spent alone. The white sheets of the draftsmen. All the experiments I conducted in secret while designing their aircraft. (My head aches as I think of this. I find it difficult to recall. The prosthetics and artificial heart cannot help me forever.) Electrostatic repulsion. Photosensitive cell steerage. The reaction of streams of ions to furnish rocket propulsion, then a means of neutralizing the decrease of gravity and other such matters. I never cared about their aircraft. Already they were obsolete. Already I had moved beyond orthodox flight and was tackling the mysteries of the boundary layer. The boundary layer was everything. Conquer that and the dream was mine. Thus I worked and theorized, the laboratory, the wind tunnel, but the theories still remained in my papers and could not be tested.

My dream was of evolution. Man's place in the universe. My dream was of Man as a mind that could transcend the body.
Yet how to achieve this? 'Man ' meant individual men. And such men, being

imperfect creatures, were distracted by hungers. The hunger for love. For admiration and power. I then tried to understand what such hungers meant and found them all in myself.

The hunger for love. In my loneliness I felt it. Somewhere, sometime, a memory almost gone, I wasted nights trying to ease my own hungers in a more common flesh. What I found was soon lost. The vulva's folds were a threat. The rigid shaft of my penis in a woman gave no more than a spasm. Yet such a spasm shapes the world. People live and die for such. And that spasm represents what most people want: admiration and power.

Learning this, I retreated. Love's deceits showed the way. I understood in my moment of grace that their needs were illusions. I retreated and found myself. I took myself in my own hands. When my need, when my sex, became a threat I gave my semen release. Thus I understood men. They were feelings, not thought. Whereas Man, that outpouring of separate men, held the promise of greatness.

Science represents the mind. It is what we must live by. It is logic and towers above the chaos of outmoded emotions. I learned this and lived by it. I stood above my crude desires. When my flesh seduced my mind from its work, I gave it instant release. A shaft of meat in the hand. The ejaculation of semen. It meant then, and to this day still means, the mere appeasement of hunger. And learning this, I was released. The call of science was in my soul. From then on I neither entered another being nor believe in men's sanctity.

Inhuman? Perhaps. But then what does 'human' mean? Only fear and confusion and doubt and emotional turmoil. To be human is to err. More: to stagnate. Men are impulse encased in flesh and bone, and alone they are nothing. But Man is something different. Man is mind over matter. Man is imperfection crawling from the slime to evolve into Superman.

I met Goddard in Massachusetts. I remember returning there. I was fifty years old at the time, but felt younger than that.

How I envied Goddard! But envied and pitied him. Another genius humiliated by his countrymen and becoming eccentric. Envy. Admiration. Both share the same bed. And so I envied his achievements, respected them, analyzed them, and felt pity for the future he would have at the hands of his fellows.

It was 1929. I looked upon him as a child. A suspicious, secretive, brilliant child with more instinct than logic. And yet he was a genius. There were

things I learnt from Goddard. Not much: just the odd, bizarre insight, some small things I had missed: peculiarities of steering systems, gyroscopic controls, various kinds of self-cooling combustion chambers – small things; all priceless. In return, he learned from me. We worked together for two years. My presence unannounced, Goddard sworn to keep me secret, we spent days in the deserts of New Mexico, unraveling mysteries. Goddard sent his rockets skyward. My soul soared aloft with them. It was 1931, a troubled year, and I knew that my time had come.
Tsiolkovski and Goddard. Both still alive then. One older, one much younger than me, both true pioneers. The basic principles of space-flight: the deaf Russian's great achievement. Then the liquidfueled rocket of young Goddard, abused beyond mention. Both stood at the threshold. Both failed the same way. Both depended upon 'honorable' men and were thus chained by small minds. Their mistake was not repeated. I did not trust 'honorable' men. What I wanted were heroes or madmen – and the latter sufficed.
I never dwell on morality. Never did, never will. Morality is the crutch of the cripple, the mask of the weak. What of Wernher von Braun? What of Walter Dornberger? Such men were neither sinners nor saints: they were quite simply scientists. Can a scientist think of morals? Should he split peas in a pod? No, what the scientists must do is pursue his great calling. By himself, he has no means. He must depend on those with power. And in doing so, he must stand aloof from all concepts of right and wrong. I always believed that. I believe it to this day. And gazing out at the wilderness, at the world of snow and ice, I think of how, after working with Goddard, I accepted this bitter truth.
There were madmen back in power. They were obsessed and visionary. To me, they represented the possibility of limitless facilities. I never thought of right or wrong. I simply took my opportunity. I left Goddard and America behind me – and I never returned.

Chapter Nine

They drove out of Galveston as the evening fell about them, a fiery sun bathing the Gulf of Mexico in a red, incandescent light. The city soon fell behind them, gave way to parched flatlands, old shacks and houses leaning on stilts, silhouetted in crimson haze. Stanford wiped sweat from his brow: the April winds outside were hot; he swore softly and glanced at Epstein,

saw him framed by the sinking sun. Epstein looked extremely tired; he rubbed his eyes and coughed a lot. Stanford grinned at him and then watched the road that cut through the bleak countryside.

'I had a call from a friend,' he said. 'He told me it happened this afternoon. He works in the Manned Spacecraft Center just outside Houston and he wants us to go there at the end of his working day. He said he would talk to us.'

Epstein smiled wearily. 'You're such an operator,' he said. 'I never imagined I'd get into the MSC, so you've just made my day.'
Stanford chuckled at that. 'Well, you know me, professor. I had this sweet girl and this girl knows this guy and this guy wants what I get from the girl, so he's very obliging.'
'You're a bastard,' Epstein said.
'I have a mom and a pa.'
'You really should settle down, Stanford. You're too old for that nonsense.'
Stanford chuckled again. 'I can't make decisions,' he said. 'You told me that a couple of weeks back and I think you were right. I'm an irresponsible sonofabitch. I can't resist my hard-ons. If it wasn't for that, I'd have been a proper scientist instead of troubleshooting for your institute. But we all have our place in life.'
Epstein almost laughed, but instead a cough emerged, making him cover his mouth with a handkerchief and spit the phlegm out. When he had finished, he cursed softly, shook his head from side to side, then glanced out the window of the speeding car, his gaze slightly unfocused.
'You should see a doctor,' Stanford said.
'I'm too busy, my friend.'
'You've had that cough a long time.'
'I've been alive a long time.'
'You're not so old.'
'I grow younger every day.' Epstein studied the bloody sunset in the west, the starkly shadowed flatlands. 'Where on earth are we going?'
'Someone's ranch,' Stanford said. 'About halfway between here and Houston. It's supposed to be just off this road. We should be there real soon.'
'What sort of rancher?'

‘A struggling one-man band. A few crops and a hundred head of cattle. Now he’s left with only the crops.’
Epstein nodded sympathetically, closed his eyes and put his head back, sinking gratefully into his seat, yearning for sleep. The sun had almost gone, the crimson sky turning to darkness, a ragged ribbon of mountains on the horizon, suffused in an ochre haze. The wind was growing stronger, howling around the speeding car, clouds of dust racing across the flatlands and whipping the cactus trees.
‘What did you find out about Irving Jacobs?’
‘I thought you were sleeping,’ Stanford said.
‘No,’ Epstein said, ‘I’m just resting. Now what about Irving?’
‘Not a thing,’ Stanford said. ‘The loss of his papers is still a mystery – and that doesn’t help much.’
‘The police?’
‘No papers. They found nothing in Irving’s car. Apparently the only thing that Irving took with him was that fucking pistol.’
‘We checked the terrain,’ Epstein said. ‘That area was definitely radioactive. I think something came down over Irving’s car and made that great circle of scorched earth.’
‘That was one hell of a scorch mark.’
‘Yes, it was huge. But assuming that something descended from the sky, that would explain the lack of tire tracks.’
‘A UFO.’
‘Precisely.’
‘It’s too incredible,’ Stanford said. ‘I just can’t bring myself to accept that. I try, but I can’t.’
‘There were UFOs all over the area. They were all tracked on radar. Three of them – one large and two small – and they were tracked near that area.’
‘I checked on Mary’s info. A lot of what she said was true. Dr Jessup committed suicide, Rene Hardy committed suicide, McDonald drove himself into the desert and shot himself in the head – exactly like Irving. She was also right about Chuck Wakely. He’d been stirring things up a bit. He was shot dead in his room in Miami a couple of weeks back.’
‘I think there’s a connection.’
‘I think you may be right.’
‘And the Philadelphia Experiment?’
‘All the doors are closed tight. The Navy categorically denies that it ever

existed… it's just one of those rumors.'
'Maybe,' Epstein said. 'And then again, maybe not. It's a known fact that the Navy's been working for years to develop a form of magnetic cloud that can temporarily render physical objects, including ships, invisible. It's also widely rumored, though not yet proven, that NASA has been engaged in research into the possibilities of antigravity. Who knows what they've accomplished? They keep quiet about a lot of their achievements. But as both of us know, their denials don't mean a damned thing.'
The sun sank behind the mountains, the blood-red dusk dissolving, the sky starry, the wind howling around the car as it headed toward Houston. Epstein exercised his stiff neck, his hands folded, primly in his lap; he was trying to avoid thinking of Mary or the relentless passage of time. He wasn't really growing younger. In fact, his age weighed upon him. He glanced out of the speeding car, saw the swirling of clouds of sand, the deepening night stretched out all around them, hybrid with mystery.
'What do you know about the CIA?'
'Odds and ends,' Stanford said.
'UFO investigations?'
'They've been involved,' Stanford said. 'No one really knows how long or how much, but they *have* been involved.'
'It is possible to check it out?'
'It wouldn't be too difficult.'
'No,' Epstein said. 'I mean, check it out in details. I want to know the whole history, from the end of the Second World War to the present day. I want to know when it started. I want to know why. I want to know if their concern was just for national security or if they're really concerned with something even bigger. I don't want the usual rumors, the speculations and conspiracy theories; I want the facts straight from the horse's mouth: the complete, detailed picture.'
'Why?' Stanford asked.
'Because I think the answer's there. Because too many of those people have come to bad ends after having a lot of trouble with the Establishment, scientific or military. Why was Jessup called to Washington? Why did Ruppelt revise his book? Why did Irving and Dr McDonald both go down the same way? McDonald was harassed and humiliated. Irving had to endure the same. Mary claims that Irving thought he was being followed – and that might well be true. Others have made similar claims. Many retired

prematurely or disappeared. So there's little doubt that investigating UFOs can lead to serious trouble. Does the government know something? Is the CIA involved? If the UFOs exist, and if they're of extraterrestrial origin, that would certainly put the wind up the government, might frighten the hell out of them. I think the UFOs exist. I also think they're of extraterrestrial origin. It's possible that the government thinks the same – or even has firm evidence. That would explain the harassment. It would explain their denials. They might be scared of people getting too close and revealing the truth.'
Stanford shook his head in disagreement. 'You're getting carried away,' he said. 'You've been at this game too many years and it's all getting through to you. Of *course* the CIA is interested; they're involved in national security. They're interested in the UFOs because they don't know what they are and because any unidentified flying object could be dangerous. It doesn't matter what UFOs are; what matters is what they *do*. And what they do is cause panic and confusion, distracting pilots and tying up communications every time there's a sighting. In short, they're a fucking nuisance. They cost time and a lot of money. If we could identify them positively as atmospheric phenomena, the pilots would no longer be distracted and the phones would stop ringing… Thus the CIA's interest.'
'But the CIA has denied that it's interested.'
'God, you're stubborn,' said Stanford.
Grinning, he rolled his eyes, turned the car off to the right, left the main road in favor of a narrow track that cut obliquely through flat wasteland. The track was rough, filled with potholes, making the car bounce and groan, its headlights almost useless in the dust clouds that swept howling across them. Stanford cursed and slowed down, trying to see through the murk, the moon and stars being blotted out by what seemed like a growing storm.
'Jesus,' he said, 'that's some wind out.'
Epstein coughed and rubbed his eyes, feeling almost suffocated, aggravated by the howling of the wind and the dense, swirling dust clouds. They were in the middle of nowhere, the storm raging in a void; he caught a glimpse of barbed wire, a gnarled tree, the black hump of a distant hill. The dust seemed to be alive, racing at them and around them, smacking the car and then exploding obliquely and spraying back down upon them. This night had no boundaries, stretching as far as the eye could see, featuring nothing but the billowing clouds of dust and the odd cactus tree.
'There they are,' Stanford said.

Epstein squinted into the storm, saw some lights far ahead, rather dull and suspended in space, the dust racing across them. He blinked and looked again, saw the lights coming closer, separating, gliding away from one another until they formed a long line. Epstein strained to see better. The lights were now a lot brighter. The car shuddered and then rolled down an incline and the lights changed again. They were actually raised up on trucks. The trucks surrounded a broad field. The lights were like the lamps of a football stadium, beaming down on the ground below. The whole scene was very strange. Epstein saw the circle of lights, the dust racing across the field, indistinct figures wandering to and fro, some bent over, gesticulating to each other. The sand blew across them, clumps of sagebrush rolled and danced, and the arc lamps formed an immense globe of light surrounded by black night.

Stanford drove up to the field, parked behind one of the trucks, and the lamps threw down a fierce white glare that temporarily blinded them. Epstein closed his eyes briefly, opened them, looked again: he saw the dust boiling through the bright light, around the men walking back and forth. All the men looked odd: they seemed to have no eyes or lips. Epstein shivered and tried to concentrate and then saw the reality. The men were wearing protective goggles, their mouths covered with white filter masks. They were waving at one another and shouting against the wind, bending over the dark, motionless bundles that littered the ground.

'Here we go,' Stanford said. He handed Epstein a mask and goggles. 'Put them on. You'll need them out there. That stuff could choke you to death.' Epstein did as he was told, sniffed the mask, felt claustrophobic, then he stared at Stanford through the misted-up goggles and beheld a strange creature. No eyes. No lips. Epstein thought of his UFO reports. There were connections wherever you cared to look and it was best not to think of them. Stanford opened the car door. He pointed ahead and then jumped out. Epstein opened his own door and slithered out and felt the fist of the wind. The wind smacked his face, punched his chest, pushed him back; he reached out and grabbed the door of the car and then pulled himself forward. The noise was eerie, bizarre, a constant, tormented howling, the wind-blown sand making a separate hissing sibilance that tortured the eardrums. Epstein felt that he was dreaming: demoniac shapes formed in the murk. A grotesque, faceless creature materialized and reached out to grab hold of him. Epstein was pulled forward. He followed Stanford toward

the lights. The dust spiraled over the trucks, around the men in the bright field. Epstein and Stanford approached a truck. A man was kneeling beside it. He was dressed in coveralls, wore the protective mask and goggles, and was studying the intestines of a cow that had been disemboweled.
Stanford waved his right hand, indicating the field illuminated with arc lamps. ‘All dead,’ he said. ‘A hundred head of cattle. All dead. Every last one of them.’
Epstein looked around the field, recognized the dark bundles, the dust settling on blood, bone and tripe, the hides slashed and peeled back. It was a scene of incredible carnage. The wind carried the stench away. The masked men moved back and forth, looking here, looking there, kneeling repeatedly and then standing up again with gloved hands dripping blood. They were using surgical instruments, probing exposed intestines and dismembered limbs, moving to and fro as if in a trance, still not fully believing what they were dealing with. Epstein shivered. It was hot, but he felt cold. He saw the gleam of white bone, a slashed udder, a pool of blood, the wind howling, the dust sweeping over all, trying to bury the horror.
Stanford led him across the field, zigzagging between the dead cattle, skirting around the bulldozer that was roaring into action, passing more blood-soaked men. The cattle were everywhere, scattered over the whole field, some stripped of their hides, their rib cages gleaming dully, throats slashed and udders chopped off, eyeballs torn from their sockets. Epstein had never seen anything like it – it was a shocking, nightmarish sight. The wind blew the sand over the men, around the trucks and arc lamps.
Stanford walked on ahead, skirting around blood-soaked pits, then turned his head and pointed at a nearby truck, telling Epstein to follow him.
Epstein nodded and continued walking. The wind pummeled his body. He put his head down and fought his way forward, trying to see through the hissing, twisting sand. Eventually he reached the truck, went around it and saw a car, a group of men squatting in the narrow space where the wind was less fierce.
Epstein approached this group and knelt down beside Stanford, seeing the tripe on the dusty coveralls, the men minus their masks. These men looked very weary and were drinking from cans of beer. The narrow space between the truck and the car afforded modest protection. Stanford pulled his mask off and Epstein gratefully did the same, then Stanford opened a can of beer, had a drink, wiped his lips and grinned at another man as if they were old

friends.
‘Help yourself to a beer,’ this man said. ‘Don’t wait to be asked.’
Stanford grinned boyishly. ‘A fine brew,’ he said. ‘I only come out nights like this on the chance of a free beer.’
‘What the hell are you doing here, Stanford? I thought this was secret. We only got the word an hour ago and we haven’t passed it on.’
Stanford winked at him. ‘An old MSC friend. He gave me the word on the hot line and I just came right over.’
‘He?’
‘Oh, well…’
‘You’ve been poking some cutey.’
‘A man has to give something in return; it’s the least I could do.’
The squatting man grinned and shook his head from side to side. ‘Oh, boy,’ he said, ‘you really are a mover… you’re some scientist, Stanford.’ He spat dust from his mouth, wiped the grime from his eyes, had another slug of beer and glanced around him, shook his head again, slowly. ‘You ever seen anything like this? It’s happening all over the country. Cattle and sheep and sometimes horses: a real butcher’s paradise.’
‘Bless the wind,’ another man said.
‘Yeah,’ said yet another… ‘the stench.’
‘Stanford, you’d better keep your mouth shut; we don’t want this widely discussed.’
Stanford nodded and sipped some beer. ‘That’s understood,’ he said. ‘We had a case like this three months ago; the very same thing.’
‘Where was that?’
‘Lubbock.’
‘I think I remember it.’ The squatting man looked curiously at Epstein.
‘Who’s this?’ he asked.
Epstein felt himself flushing, feeling a little out of place, but he looked the squatting man in the eyes and said, ‘Frederick Epstein.’
‘Who?’
‘Dr Epstein’s from the Aerial Phenomena Investigations Institute in Washington, DC,’ Stanford said. ‘He’s been on a few cases like this before and he doesn’t talk much.’
‘The APII?’ the squatting man said. ‘So why the hell are you interested in this?’
‘Come *on*, Miller!’ Stanford said.

‘Come on, *nothing*,’ Miller retorted. ‘I don’t know what you birds want out there. It’s got nothing to do with you.’
‘Yes, it has,’ Epstein said. ‘As you just said yourself, there’s been a number of cases like this right around the whole country, and invariably they’ve occurred when UFOs have been reported. Cattle mutilation isn’t commonplace, so there might be a connection.’
Miller drank some beer, wiped his lips with his free hand, shook his head wearily from side to side and sighed in despair.
‘I don’t believe this,’ he said. ‘You fucking dogs stop at nothing. The slightest chance to pin something on a UFO and you can’t wait to do it. Well, this has nothing to do with UFOs. There’s no connection at all. What we have here is the work of a gang of rural deviants – or possibly some bizarre religious ritual. It may be sick, but that’s all it is: a gang of headcases on the loose.’
‘I don’t believe that,’ Epstein said.
‘You come from Washington, DC,’ Miller said. ‘You don’t know what some of these country boys are like. The lack of sex drives them crazy.’
Stanford chuckled at that. ‘Not *my* problem,’ he said.
‘No,’ Miller said, ‘not your problem. You’re a clean living city boy.’ He sighed again and stood up, finished off his can of beer, threw the can into the back of the truck and then held up his face mask. ‘We’ve got work to do,’ he said. ‘We have to bury these carcasses. I can’t sit here and talk to you lunatics. Go on home. On your feet, boys.’
The other men cursed and groaned, wearily clambered to their feet, started putting on their face masks and goggles, the dust swirling around them. Stanford stood up as well, handed his beer can to Epstein, walked up to Miller, tugged his elbow and leaned very close to him, talking into the hissing wind.
‘Just tell me one thing,’ he said quietly. ‘Have you had any UFO reports?’
Miller looked coolly at him, turned away and surveyed the field, his shadow stretching out from his feet, heightened by the bright lights.
‘I don’t know what you’re talking about,’ he said.
Stanford wasn’t smiling. ‘I’m talking about fucking UFOs. I’m wondering what you boys are doing here if what you told me is true.’
‘*What* did I tell you?’
‘You told me this was nothing. You told me it was the work of some crazies. If so, it’s a police case.’

‘We’re burying the bodies,’ Miller said.
‘You work for NASA,’ Stanford said. ‘You work for a decontamination unti and you’ve done this before.’
‘So what’s your bitch? Dead cattle can contaminate. We came out here because we don’t want this mess causing any disease. We’re the nearest available personnel. That’s all there is to it. We got called out because there’s no one else and because we’re equipped. The local health officer called us out. He said he wanted this mess cleaned up. He said it would take too long to get civilians, and he asked us to help. There’s no mystery to it.’
‘Bullshit,’ Stanford said.
‘Suit yourself,’ Miller said.
‘That apartment in Austin,’ Stanford said. ‘It’s booked out from this moment.’
Miller sighed, shook his head in disgust, walked a little bit away from his men, tugging Stanford along with him. They stood together at the edge of the field, the carnage spread out behind them, the lamps on the trucks beaming down, the sand spiraling and hissing around them.
‘You’ve got a friend in MSC?’
‘That’s right,’ Stanford said.
‘And he’s the one who told you about this?’
‘You’ve hit the nail on the head.’
Miller nodded and rubbed his eyes, the wind tugging at his clothes, the dust sweeping across the flat field and the slumped, bloody cattle.
‘So you’re going to see him.’
‘Right,’ Stanford said.
‘Then presumably he’ll tell you about it and I’ve nothing to lose.’ Miller glanced around, making sure he was out of earshot of his men. Epstein moved closer to him. The wind made it difficult to hear, and Miller spoke softly. ‘There’s a rancher and his daughter. The rancher seems to be in shock. The daughter’s about eighteen years old and she doesn’t seem too bright. The rancher’s still babbling. The daughter doesn’t say much at all. The rancher says he was in the house, having dinner with his daughter, when they heard a humming sound, the whole place went bananas, and a strange light, much brighter than the sun, almost blinded them both. The rancher dived to the floor. He says his daughter just sat there. The light faded and the rancher stood up and grabbed his rifle and rushed outside. At first he saw nothing. Then the humming began again. His daughter joined

him on the porch as he looked up, so she looked up as well. There was something over his grazing land. He's pretty vague about what it was. All we know is that he believes it was huge and that it glowed and climbed slowly. I don't think he's all there. I think they're both a bit nuts. He says the object was as big as the field, that it was silvery and disk-shaped. It hummed and climbed slowly. There were lights right around its rim. It ascended to a hundred feet or so and then it shot off obliquely. His daughter smiles when he mentions it.'
'What about the MSC?'
'They've had radar lock-ons. The blips appeared, then disappeared, kept returning and disappearing, and some jets were sent up to pursue them, but there wasn't a hope. Those unidentifieds were moving fast. They made the jets seem like toys. They were going faster than any aircraft we know of and the jets never saw them. The radar located them here. Same place and same time. We were sent out immediately but when the rancher saw us coming, he jumped in his truck and came out here as well and almost went crazy. And here's what we all found.'
Miller waved his right hand, indicating the floodlit field, the men stooped and working hard in the churned-up dust, the bulldozer roaring, the dead cattle everywhere.
'Are these storms commonplace?' Epstein asked.
'Not at this time of the year.'
'It might be electrical,' Stanford said.
'It might be anything,' Miller said. He waved at the nearby men, told them to get back to work, then he put on his protective mask and goggles, and said, 'Come with me.'
Stanford and Epstein followed him, skirting the edge of the field, both wearing their face masks and goggles, bent against the fierce wind. Miller climbed into a jeep, told them to get in the back, and when they did so, he shot off down the road, the dust obscuring his headlights. He drove for about five minutes, driving blindly and dangerously, bouncing over potholes and mounds of earth until he came to the ranch. It was badly dilapidated, an overgrown shack on stilts, creaking in the wind and the hissing dust, its lights piercing the darkness.
Miller drove up and braked, killed his headlights and jumped out, waiting for Stanford and Epstein, then walked up to the steps. The house lamps were all lit, framed by shuddering windows, and the light fell from the

windows to the porch, illuminating the silent girl. The girl was unkempt, her long hair whipping across her face. She was wearing a cheap cotton dress, her legs and arms were bare, and she stood there with a thumb in her mouth, staring up at the sky.
'Hello, Emmylou!' Miller shouted. 'What are you doing, standing out there? You're going to choke in the dust!'
The girl moved slowly, turning her head with clear reluctance, as if not wanting the intrusion, gazing down at them, her thumb still in her mouth, her brown eyes uncommonly large. She didn't say anything, simply studied Miller and Epstein. She glanced at Stanford and her eyes flicked away and then came back toward him. She smiled, the thumb still in her mouth, looking directly at Stanford.
'Can we come in?' Miller asked.
The girl blinked and then nodded. The three men mounted the steps to the porch and then stopped by the front door. They are stared at the girl. The howling wind pressed the dress to her body, revealing large breasts and broad hips. The dress had buttons up the front, but the buttons were undone up to her thighs. The dress was being blown back, exposing her legs which were tanned and quite muscular.
Stanford studied her at length. He couldn't take his eyes off her. She had the insolence of a child, a sort of lazy sensuality, just standing there and sucking her thumb, staring at him and smiling. Stanford wanted to put it into her. He suddenly saw himself doing it. The lust took him with immediate, startling force and stripped him of commonsense. He shook his head and controlled himself. He was sweating and felt feverish. The girl sucked her thumb, smiling slightly, ambiguously, while stroking the back of the ankle of one bare foot with the toes of the other.
'You're the daughter,' he said.
The girl smiled at him and nodded.
'We want to talk to you and your father. We want to know what you saw out there.'
The girl was standing only a few feet away. Stanford wanted to touch her. He could scarcely stop himself from doing so. The girl sucked her thumb and stared at him and offered no reply.
'Can we go inside?' Miller asked.
The girl nodded dumbly. Miller knocked on the door and then opened it and they followed him in. The house was brightly lit, with oil lamps near the

windows, casting shadows on the dusty, plank floor and the makeshift furniture. Stanford stood beside Epstein, the girl inching in behind him. He felt that she was pressing against him and it made him uncomfortable. The shadows fell down flaking walls, crept over handmade wooden chairs. The old rancher was at the table, his hair white, his chin unshaven, a bottle close to his left hand, most of the whiskey gone. Miller touched him on the shoulder, shook him gently, murmured something. The old man raised his head, licked his lips, gazed around him, stared at Miller and went bright red and then reached for the bottle.

'Not again,' he growled. 'No!'

Miller stepped back a little. 'Just once more,' he said. 'Just tell these men what you think you saw. It could be important.'

The old man drank from the bottle, slammed it down and glared at Miller; his eyes were bloodshot and he had the glazed look of someone not in control of himself. He wiped his lips with one hand, the fingers blistered and grimy, flicking whiskey from his lips and then lowering the hand to scratch at his chin. Miller's shadow fell across him, blotting out half of his face, and he moved out of the shadow and glared at Epstein and then settled on Stanford. The girl was standing behind Stanford. He heard the rustling of her dress. He thought of her dress sticking to her skin, to her hot thighs and soft breasts. Stanford felt very strange, obscurely threatened by the girl, having to force himself not to turn around and stroke her breasts and belly. He couldn't understand the feeling: it was something more than lust; it was a dream carried in on the wind and now surrounding his being. Stanford felt sick with longing; he had a hard, pulsating erection. He stepped back into the shadows to hide it, but the girl moved back with him. The old man was staring at him, glaring at him, snorting contemptuously, then he glared at Miller and Epstein in turn and started drinking more whiskey. His hand was visibly shaking. He was not as fierce as he looked. He spilled some whiskey down his shirt and then cursed and slammed the bottle back down.

'I saw nothing,' he said. 'Nothing!'

'*Please*,' Miller said.

'Go to hell,' the old man said.

'It's important that you try to remember.'

'Go to hell. I saw nothing.

The girl moved away from Stanford, slipping quietly through the shadows, pressed herself against the window's wooden frame and gazed up at the sky.

She wasn't sucking her thumb: she was biting her tongue and humming distractedly, her belly pressed against the windowpane, her spine arched, her breasts outthrust. Stanford tried not to stare; his eyes were drawn against their will. Shadow and light flickered over the girl, over Miller and Epstein, over the old man who sat at the table and spilled whiskey and cursed.
'It was silvery,' Miller prompted.
'I saw nothing,' the old man growled.
'You said it was as big as the field.'
'Jesus Christ… *Fucking Jesus*!'
The old man kicked his chair back, stood up straight, clutched his head, then let out a terrible anguished scream that lacerated them all. Miller and Epstein stepped back. Stanford glanced at the girl. She smiled and slid her thumb into her mouth, then turned her gaze toward her father. The old man was clutching his head, shaking it wildly and screaming. He suddenly slammed his fist down on the table, swung it back, swept the bottle off. The bottle flew across the room, struck the wall and exploded, the whiskey spraying over Miller and Epstein as they hurried to the front door. Miller pulled the door open. The girl sucked her thumb and hummed. The old man screamed again and grabbed the table and then tipped it over. Epstein followed Miller out. Stanford edged along the wall. The old man grabbed his rifle, swung it wildly around his head, and started sweeping cups and plates off a shelf that ran above the fireplace. Stanford glanced at the girl. She was smiling and humming softly. She was still sucking her thumb and her brown eyes were luminous and teasing. Stanford edged out through the door. The old man screamed and smashed things. Stanford backed into the wind and blowing sand and stumbled down the porch steps. Miller and Epstein were in the jeep, its engine running, the headlights on, and Stanford scrambled into the back, beside Epstein, pouring sweat, his heart pounding. The old man lurched through the doorway, a silhouette in yellow light. He rushed forward and put his hand against an upright and then glared at the three of them.
'I saw light!' he shrieked. '*Light*!'

Stanford drove along NASA Highway 1, toward the Manned Spacecraft Center. He felt very strange. He felt terribly alone. Epstein was sitting in the sea right beside him, but he didn't seem real. Stanford drove fast and

recklessly, now ignoring the storm, oppressed by the heat and the noise, obsessed with the girl.

He thought back on what had happened, turned it over in his mind, tried to cast it out and concentrate on his driving, but always returned to the mystery… What had happened back there? What had drawn him to the girl? Was there a connection between the girl's odd air of distraction and her father's wild outburst? He recalled the old clutching at his own head, shaking it dementedly from side to side, screaming as if trying to break loose from a terrible anguish. What had actually made him scream? What had made him turn so violent? And what secret did he share with the daughter who sucked her thumb and smiled mindlessly? Stanford tried to think it through. He could only think of the girl. He saw her standing on the porch, in the light from the window, stroking the back of the ankle of one bare foot with the toes of the other. Stanford couldn't make sense of it. His lust was almost supernatural. It was not based on her breasts and broad thighs, but on her luminous, empty eyes. Stanford felt himself shivering. The howling wind tore at his nerves. He glanced at Epstein, at that lined, bearded face, and wondered what he was thinking.

'What do you think they saw?' he asked.
'I don't know,' Epstein said.
'They sure as hell were acting pretty strange.'
'Yes, they were,' Epstein said.
'I think what they saw affected them.'
'Yes, no doubt it did.'
'I mean, I think it might have *physically* affected them.' 'You think so?' Epstein said.
Stanford didn't reply to that. He didn't know what to say.

Looking ahead, he saw more clouds of dust sweeping across the dark road. The storm was fierce and unrelenting, blotting out the moon and stars, the spinning dust forming into shapes that seemed almost alive. Stanford cursed again, whispering. The noise and darkness were getting to him. He thought he saw some lights far ahead and that made him feel better.

'That looks like it,' he said.
'The Manned Spacecraft Center?'

‘Yes,’ Stanford said. ‘Straight ahead. You can’t see much from

here.’

Epstein sat up and looked ahead. He thought he saw lights in the distance, but he couldn’t be sure. The dust was everywhere, racing at them and around them, hammering at the car and making it vibrate. Epstein didn’t feel well. He kept thinking of the hundred butchered cattle, the men with faces hidden by masks and goggles. Epstein shivered and coughed and glanced sideways at Stanford; his friend was just a dark form in the night, a faint light in his eyes. Epstein wondered what was wrong: his young friend was too quiet; he sensed a great tension in Stanford and wondered what was causing it. Not the hundred butchered cows. Not the raving old man. Stanford was much tougher than that, was far stronger than he was. Epstein looked again at his friend, heard him murmuring something. He wondered what Stanford was thinking, then he studied the road ahead. He saw the distant lights, shining weakly through the storm, emphasizing the awful desolation of this dark, empty plain.

‘That man, Miller,’ Epstein said. ‘How did you get him to talk. I heard you say something about an apartment. What did you mean by that?’

That finally got a chuckle out of Stanford. ‘God, you’re sharp,’ he said. ‘It’s an apartment that I’ve had for years in Austin, and I let certain friends use it. Miller’s a married man. He’s not a happily married man. I’ve been letting him use the place this past few months for his one great affair. He’s not experienced at that game, so my place is vital to him. He doesn’t want to lose his bit of action, so his tongue started wagging.’

‘That’s blackmail,’ Epstein said.
‘Too true,’ Stanford replied. He chuckled again and looked at the lights ahead and then he started to frown. ‘Jesus Christ,’ he said. ‘What the hell…?’

Epstein looked ahead and saw the lights through the murk. The car was racing toward them, but the lights remained unchanged: the same size, the same distance away, as if actually pacing them. Epstein sat up very straight. Stanford stepped on the gas. The car roared and raced into the storm,

heading straight for the lights. Epstein suddenly felt unreal. He bent forward and strained to see. There were twenty or thirty lights, very weak, not too big, spread out at equal distances in a long line that straddled the road. Stanford cursed and gunned the engine, but the distance between the lights and the car remained exactly the same.

'Godammit, *they're moving*!'

Stanford almost screamed the words. He kept his eyes on the lights. The car raced into the murk, doing seventy miles an hour, but the distance between it and the lights didn't alter the least.

'They're above the road,' Epstein said.

'Damned right!' Stanford exclaimed. 'They're a good hundred feet above the road and they're definitely *moving*!'
'How far away do you think they are?'
'About a quarter mile, I'd say.'
'Then that line of lights is three hundred feet wide.'
'Jesus Christ… *Jesus Christ*!'
Stanford put his foot right down and the car leaped ahead, throwing Epstein back into his seat in an untidy heap. He quickly pushed himself back up, heard the howling, whistling wind, saw the lights in the sky far ahead, glowing through the dense dust clouds. Stanford kept driving, his gaze bright and intense; he went all out, but the distance remained the same, the lights luring him on.
Stanford cursed and kept driving. Epstein held on to his seat. The line of lights was dead straight, very wide, and it kept the same distance from them. There was something weird about it. The car was roaring against the wind. The line of lights appeared not to be moving, but it stayed well ahead of them. Then it suddenly stopped. The lights rushed at them and grew larger. They were glowing down through the dense dust, illuminating the road below.
'*Shit*!' Stanford snapped.
He slammed his foot on the brake pedal, making the car shriek and skid violently around in a spiraling cloud of dust, almost turning full circle. Epstein's head hit the windscreen, bounced back into the seat, his hands darting out to press against the dashboard as the car continued skidding

around, its rear facing the motionless lights. Stanford cursed and killed the engine, opened his door and jumped out, was pummeled by the wind and dust and saw the lights rising vertically. Epstein followed him out, wiping blood from his forehead, and they stood there, one at each side of the car, looking up disbelievingly.

The long line of lights was rigid and didn't sway at all. It was not too far away, about two hundred feet up, the separate lights now yellow, red and blue, glowing through the dust storm. The lights rose slowly, making no discernible sound, growing smaller, moving closer together, then finally merging as one. This one light was long and thin, a shimmering blade of pure whiteness, and it shrank until it looked like a glowing sphere. The glowing sphere slowly climbed above the storm and disappeared in the black sky.

Stanford and Epstein were stunned, glancing wide-eyed at one another. They stood there for a long time, staring up at the sky. Eventually, being pummeled by wind and dust, they went back to the car.

'Where are we?' Epstein asked.

'About a mile from the MSC. I thought that thing was heading straight for it, about to crash into it.'

'It was low enough,' Epstein said.

'Damned right, it was low enough. It was low enough and big enough to level the MSC to the ground.'

'They must have seen it,' Epstein said.

'They couldn't have missed it,' Stanford said. 'Let's go. I want to find out what's happening. Those bastards can't deny this one.'

Stanford drove more carefully now, feeling disorientated, his nerves flayed by the wind and the dust and the night's weird events. He thought of the girl on the porch, of her luminous, empty eyes, of her firm breasts and naked brown thighs, her belly pressed to the windowsill. His lust returned immediately, a primitive, unreasoning hunger, and he shook his head and tried to think of something else: the old man's sudden violence… What had descended over the field? Just what had the old man seen? Stanford tried to think it through and failed dismally, his lust growing and blinding him.

Epstein remained silent, feeling stunned and exhilarated, thinking of the vertically climbing lights and their serene, silent beauty. It all seemed fantastic. The whole evening was like a dream. He felt slightly dizzy, coughed a lot and rubbed his eyes, exhausted and excited at once, his heart

pounding dramatically. It was his first UFO sighting and it had filled him with awe. He thought of the butchered cattle, of the old man screaming '*Light*!', and then he wondered if what he had just seen had also materialized over the grazing field.
The storm was almost unnatural and certainly unprecedented; it had emerged from a placid, crimson dusk and showed no sign of abating. Epstein thought of the ascending lights – that line of lights that never swayed – and wondered what kind of object it was that could fly in this storm.
Glancing ahead, Epstein saw another line of lights, slightly obscured behind the dense clouds of dust, hanging dimly in darkness. He rubbed his eyes and looked again, feeling decidedly odd. The lights grew larger and illuminated a fence and a wide metal gate. It was the Manned Spacecraft Center. The lights shone from white buildings. Epstein sighed with relief and then coughed and wiped his lips with a handkerchief.
Stanford drew up to the gate and stopped the car as a guard came toward them. The guard was stooped against the wind, pressing his cap to his head, the dust swirling around him and beating at him, covering his uniform. When Stanford rolled his window down, the dust roared in through the car. The guard's masked face appeared at the open window, his eyes hidden by goggles.
'Dr Stanford!' Stanford shouted, showing the guard his official MSC pass. 'This here's Professor Epstein! We have an appointment with Captain Armstrong of the Space Science and Technology Administrative Office!'
'I'm sorry, sir,' the guard said. 'All appointments have been cancelled. We're in the middle of a special security exercise and no one's allowed in.'
'You don't understand, corporal… I repeat: We have an *appointment*.'

'And I repeat, sir: All appointments have been cancelled. You'll have to leave now.'
Stanford looked past the guard, saw the closed gate and high fences, the roads between the buildings packed with troops, all heavily armed.
'A *security* exercise?'
'That's right, sir. Just routine.'
'That's an awful lot of men for a routine security exercise. And they're all heavily armed. What the hell's going on here?'
The guard's face was impassive. 'I'm sorry, sir. You'll have to leave.'

‘Listen, corporal, we have a *serious* appointment. Now get on that telephone.’
The corporal straightened up, waved his hand at the guard’s box, and another man, a sergeant, walked out, armed with a rifle.
‘What’s up?’ he asked.
‘We have an appointment,’ Stanford said.
‘All appointments have been cancelled,’ the sergeant told him. ‘You’re not allowed in.’
Stanford looked past the sergeant, past the fence, into the complex, saw the troops lined along the linear roads, all studying the sky.
‘Sergeant,’ he said, sounding calmer than he felt, ‘we just saw some very strange lights straddling the road about a mile or so back. They were moving, and then, when we approached them, they climbed vertically– climbed so slowly we couldn’t believe it - then they simply vanished. Any idea what they were?’
‘Probably just a helicopter, sir.’
‘Too big to be a helicopter, sergeant. Try something else.’
‘I don’t know, sir.’
‘You should have seen them from here, sergeant.’
‘No, sir, we didn’t.’
‘You couldn’t have possibly missed them, sergeant; they formed a very long line.’
‘We haven’t seen anything.’
‘Why are your men scanning the sky, sergeant?’
‘They’re looking for helicopters, sir. It’s a security exercise. They’ve been tasked with reporting the helicopters as soon as they see them.’
‘You have helicopters up there in this storm?’
‘That’s right, sir.’
‘You think helicopters can fly in this weather?’
‘Yes, sir. I suppose so.’
‘And you’re not going to report the lights we saw?’
‘We haven’t seen any lights, sir. Now please leave the area.’
Stanford nodded, studied the soldiers behind the fence, saw them all staring up at the night sky.
‘Sergeant, please get on that telephone and inform Captain Armstrong that we’re here.’
‘I’m sorry, sir. I can’t do that.’

‘What the hell do you mean, you can’t do it?’
‘Captain Armstrong isn’t here, sir. No administrative personnel are allowed in until the end of the exercise.’
‘But he *told* us to meet him here!’
‘That was probably before he knew about this exercise. He’s not here right now, sir.’
‘Sergeant, we only spoke two hours ago.’
‘Sorry, sir.’
‘You mean you pulled this security exercise without giving anyone any notice?’
‘Please, sir, you’ll really have to leave now.’
The sergeant straightened up and held the rifle across his chest, squinting down through the dense sand, unprotected by goggles. Stanford glared at him, unwilling to move, then the corporal placed his right hand on his pistol and reached for the door handle. Stanford noticed the gesture, cursed softly and shook his head, then he turned on the ignition, reversed the car sharply, and headed back along NASA Highway 1, cutting a swathe through the storm.
‘*Godammit*!’ he exclaimed. ‘What the *hell’s* going on? Those bastards were lying through their teeth. They know something is up there.’
‘They were certainly scanning the sky,’ Epstein said.
‘Damned right,’ Stanford said. ‘They’ve seen something up there and now they’ve locked the fucking gates and they’ve got that placed looking like a war zone. And now Armstrong… Oh, *Jesus*!’
He smacked the steering wheel with one hand, shaking his head in frustration, and glanced at Epstein with a dangerous gleam in his eyes.
‘Where are we going?’ Epstein asked.
‘Clear Lake,’ Stanford said. ‘Armstrong lives in Nassau Bay and I’m pretty sure he’s hiding out there right now. I want to talk to that bastard.’
Epstein sank back into his seat and closed his eyes, his exuberance giving way to exhaustion. The car roared and vibrated, pummeled constantly by the storm, and Epstein floated in a weird, light-flecked darkness, now removed from himself. He saw the long line of lights, rising slowly and silently, floating up through the wind and dust with an awe-inspiring majesty. Then he visualised the rancher’s field, the same lights descending quietly, the cattle bellowing in panic and confusion as the dust beat about them… What had happened after that? What had caused the terrible

carnage? Indeed, had anything descended at all or had the rancher imagined it…? Epstein coughed and wiped his lips, opened his eyes and surveyed the storm. Clouds of dust swept around the speeding car and raced across the dark flatlands.

'It's not like Armstrong,' Stanford said. 'I've known that guy for years. He's been passing me information for years, and he's always been reliable. He told me to meet him there. He's never missed an appointment. If that was just a security exercise, he'd certainly have known about it and wouldn't have sent us out there in the first place. Those soldiers are looking for something. They sealed that place off at the last moment. They must have sealed it off just after Armstrong called me, and there must be a reason for that. Armstrong said he had something to tell me. That usually means unidentifieds. I think those soldiers in the MSC and the NASA decontamination team are part and parcel of the very same thing. There's something over this area.'

He slowed the car down, pointing his finger at murky lights, turning into the sleepy suburb of Nassau Bay and cruising along its empty streets. There were lights on in the houses, silhouettes framed by windows, the lights beaming out and falling on neat lawns, the shrubbery bent by the wind. Stanford cruised for some time, studying the left side of the road, straining to see through the clouds of dust and muttering under his breath.

'That's it,' he said eventually, pulling over to the right, stopping the car on a gravel drive that fronted a chalet-styled charcoal-brown house. He killed the engine and switched the lights off, opened the door and slipped out; Epstein followed him and joined him on the porch as he was pressing the doorbell. They heard the sounds of revelry inside, a lot of laughing and shouting. Stanford pressed the bell again, looking angry and impatient. The man who opened the door was flushed with alcohol, his bloodshot eyes blinking and settling on Stanford, opening wide with surprise. Her had a half finished drink in his right hand.

'Oh, Christ!' he said softly.

'We had an appointment,' Stanford said.

The man seemed reluctant to open the door farther, his shoulder leaning against it.

'Get out of here,' he said.

'Let us in,' Stanford said.

'I can't talk to you, Stanford. Go away. I've got people in here.'

‘Your buddies from the MSC?’
‘That’s right,’ Armstrong said. ‘It’s a private party, Stanford. I can’t talk now. Just get the hell out of here.’ He started to shut the door, but Stanford stopped it with his foot.
‘We’ve come a long way,’ he said. ‘We came just to see you. You said you had something to tell us – now you’re slamming the door. What the hell’s going on?’
‘Nothing,’ Armstrong said.
‘Then let us in,’ Stanford repeated.
‘I can’t,’ Armstrong said. ‘It’s a private party. For Christ’s sake, get out of here.’
‘I love parties,’ Stanford said.
‘You can’t come in, Stanford.’
‘Why not? What the hell are you worried about? I’ve been in there before.’
‘You know damned well why not.’
‘You brought us out here,’ Stanford said.
‘I said I’d meet you at the MSC.’
‘You weren’t there,’ Stanford said.
A burst of laughter from inside, more shouting, someone singing. Armstrong glanced nervously over his shoulder, then looked back at Stanford.
‘Godammit,’ he said.
‘What’s going on, Armstrong. How come you suddenly throw a private party instead of meeting us as planned?’
‘It just happened,’ Armstrong said.
‘That’s bullshit,’ Stanford said. ‘You threw that party because you didn’t want us to come here and find you alone. You don’t want to talk. You’re frightened of something. You were going to tell me something and now you’re scared shitless. I want to know why.’
‘I’ll give you a call,’ Armstrong said.
‘I don’t want a goddamned call. I’m not leaving here until I know what’s happening, so you’d better start talking.’
‘Give me a break, for Christ’s sake!’
‘Why?’ Stanford said.
‘I’ve got the CIA on my back.’
‘We’re coming in,’ Stanford said.
He started to push his way in, but Armstrong resisted him, glancing

nervously back into the house and wiping his lips with a jittery hand. Then he looked back at Stanford. ‘Okay, *okay*!’ he whispered, stepping outside and closing the door behind him. He was a small man, potbellied, his hair thinning and turning gray; he glanced back over his shoulder, at the closed door behind him, then he turned reluctantly into the howling wind and spoke directly to Stanford.
‘This is the last time,’ he said. ‘I won’t talk anymore. Don’t ask me why – I won’t tell you – but this is the last time.’
‘You mentioned the CIA.’
‘No, I didn’t,’ Armstrong said. ‘Remember that: I didn’t say a word. I didn’t mention the CIA.’
‘Okay,’ Stanford said, ‘I never heard it.’
‘Good,’ Armstrong said. ‘Now listen carefully to the rest of this and don’t ever forget it. You don’t call me anymore. You understand that, Stanford? What I say to you tonight is the end. I’ll only talk on those terms.’
‘Christ, Armstrong, we’re old friends!’
‘Shut up. There’s something else… This conversation never happened. The last time we talked was on the phone, a couple of hours ago. We haven’t spoken since then. We never had this meeting.’
They stood facing one another, the dust sweeping across between them, the wind shaking the wooden railings of the porch. Epstein said nothing, feeling embarrassed and guilty, ashamed of his complicity in this bullying, avoiding Armstrong’s frightened eyes.
‘It’s a deal,’ Stanford said.
‘Okay,’ Armstrong said. He licked his lips and nodded, glancing nervously left and right, ascertaining that there was no one else on the porch, seeing only the swirling dust. He was still holding his drink, a half empty glass of bourbon, and he finished it off and wiped his lips and looked directly at Stanford.
‘There’s a flap on,’ he said. ‘It’s a very big flap. In fact, it’s the biggest flap we’ve ever had and that place is bananas. It all started about three hours ago. We received some calls from our pilots. They reported seeing unidentifieds over the Gulf of Mexico, traveling in a northerly direction at incredible speeds. These objects were silvery lights. The pilots refused to comment further. The sightings occurred an hour before sunset and continued till darkness. Meanwhile, we were getting radar lock-ons. These lock-ons located the unidentifieds not over the Gulf of Mexico, but over a

local farmer's ranch. According to the radar, something enormous had come from the direction of the Gulf of Mexico, circled around at forty thousand feet over the Manned Spacecraft Center, and then descended as three separate blips over the ranch. These objects went off the scopes when they entered the radar's ground clutter.'

Armstrong glanced about him, left and right along the porch, his gaze wandering to the far side of the street as if searching for someone. There was no one in the street. The storm was keeping them all inside. Armstrong spat dust from his mouth and rubbed his eyes and then squinted at Stanford.

'We were going to scramble some jets,' he said, 'but just as we gave the order this dust storm blew up out of nowhere. That effectively grounded the jets – the winds over the airstrip were incredible – but we still kept getting lots of unidentifieds. These reports were coming in by telephone from other radar stations located at White Sands, Los Alamos and the whole Gulf of Mexico area – and then, according to our own radar readings, the unidentifieds were suddenly right above us. Naturally, because of the dust storm, we still couldn't scramble the jets, so we just had to sit there and tear our hair out. Then, about half an hour before I called you, the three objects above the ranch reappeared on the radarscopes, merged until they became one, and this single, much bigger object started flying toward the Manned Spacecraft Center, doing no more than thirty miles an hour.'

'*Thirty* miles an hour?'

'That's what I said.'

'That's impossible.'

'You bet.'

'And it wasn't just a weather balloon, being blown horizontally by the storm?'

'No, Stanford, it wasn't.'

The sounds of the party continued inside, growing louder each minute. Armstrong listened at the door, nodded his head in satisfaction, then glanced again along the porch, his bloodshot eyes shifting nervously.

'We all went outside,' he said. 'We observed this thing flying over us. It was flying above the storm, but it was pitch black out there, so all we could see were its lights. The lights were multicolored and formed a perfect circle. They were hazy in the darkness. There were no visible features to measure them against, but that circle of lights looked enormous… The object must have been a few hundred feet up, but it *still* looked enormous… It just

glided right over us, hardly moving at all, then it went off in an easterly direction and its lights abruptly blinked out. When we went back inside, there were unidentifieds all over the radarscopes.'
Taking a deep breath, Armstrong gazed up at the sky to see nothing but a curtain of dust. He shook his head disbelievingly from side to side and started talking again.
'Shortly after that sighting we received a call from the local sheriff, telling us to get out to the ranch. Bearing in mind what we had seen, we complied immediately and soon received a phone call from our boys. No need to recount the message – you've already been out there – but when our boys found out what was happening, the MSC intelligence promptly ordered us all off the base. Naturally, we were furious. We wanted to know what was going on. What we were told was that we hadn't seen or heard anything, that loose talk could lead to trouble for us, and that we were to go to our homes and remain there until further notice. That's why we're all here. That's why I can't talk to you again. What happened out there is unprecedented – and we're all pretty scared.'
'The CIA?'
'I didn't say that.'
'Right. You didn't say it. Just tell me about that field of gutted cattle. Where does that fit in?'
'I don't know,' Armstrong said. 'Swear to God, I don't know. All I know is that it's happened before – all over the country.'
'One of your men said it was a bunch of local crazies, but I can't really buy that.'
'One final thing, Stanford, and that's it… I won't talk anymore.'
'Okay, one last thing.'
'It wasn't a bunch of local crazies. That wasn't amateurish butchery. Whatever the reason for the butchery, it was done with a frightening efficiency. Those animals were killed with an unknown nerve gas, they were sliced up with tools that must have been razorsharp; and their tongues and their eyes, their genitals and their udders, were removed with a surgical precision and then spirited away. Don't ask me why. It doesn't make any sense to me. But those animals were slaughtered by a bunch of nutters – they were professionally butchered.'
'The decontamination unit?'
'The area's radioactive. That's why coyotes and buzzards won't touch the

carcasses. It's always the same.'
'The old rancher and his daughter?'
'That's as far as I go, Stanford. That's it. I'm not saying another damned word. Don't ever call me again.'
Armstrong opened the door, started into the house, hesitated, and then turned back to face them, his gaze fixed on Stanford.
'We're old friends,' he said, 'so I'll give you some advice. Don't go back to that ranch. I warn you, don't be tempted. Whatever you do, don't go back there. It's not worth the trouble.'
He stepped into the house and slammed the door shut. Stanford stood there, his gaze fixed on the closed door, then he turned to Epstein, shrugged his shoulders, shook his head, stepped down to the dark gravel driveway and walked back to his car. Epstein followed him automatically, feeling dazed and exhausted, fighting against the howling wind and dust, wondering how this would end. Once in the car, he stared at Stanford, now pale and too tense. Stanford angrily started the car, drove out into the road, and turned back the way they had come, looking determined.
'I'm going back there,' he said.
'To the MSC?' Epstein asked.
'No,' Stanford said. 'To the ranch.'
'Oh, my God,' Epstein murmured.
He put his head back on the seat, closed his eyes and welcomed the darkness, silently cursing the wind and the dust and the night's teeming mysteries. He kept his eyes closed, refusing to look outside the car, letting the anger take hold of him and shake him back to wakefulness. He then thought of the butchered cattle, of the old rancher and his daughter, of the lights in the sky and the guards at the MSC, of Armstrong's reluctance to talk and Stanford's subsequent fury. Something odd was definitely happening. It was causing widespread panic and confusion. He and Stanford had been lied to, locked out and warned off; the events of the night were being suppressed and that meant they were real.
Epstein coughed and muttered an oath, opened his eyes to look at Stanford, saw his profile silhouetted in the window, the storm raging beyond him. Stanford's normal good humor had finally deserted him. He had never looked so cold. The wind and dust were pummeling the car, but he just kept on driving.
Eventually, they turned off the road, went along the familiar track, passed

the flatlands that stretched into the darkness on both sides, and stopped near the crest of the hill that led down to the ranch. Stanford killed his headlights and they both stared straight ahead. A ghostly light formed a huge fan in the sky beyond the crest of the hill.

'What the hell…?' Stanford said.

After glancing quizzically at Epstein, he opened his door and slipped out, letting the wind sweep the dust through the car. Epstein coughed to clear his throat, covering his eyes with his hands, then he followed Stanford out of the car, into the storm's awful fury.

The storm seemed to be worse than ever, much louder, more violent, the dust lashing their faces with remarkable strength. They had to force themselves forward, shielding their eyes with their hands, stooped over as if pushing against a wall, being pummeled from side to side. Epstein felt suffocated, dazed, slightly frightened; he saw Stanford on the hill, his clothes flapping about him, silhouetted in the large fan of light that split the darkness ahead. Epstein struggled up to him, reached out to grab his shoulder, and they stood there, neither saying a word, looking down on the ranch.

The area surrounding the ranch was floodlit, filled with trucks and armed troopers, some of the soldiers wearing protective masks and goggles, staring up at the sky. Other soldiers were hard at work, crouched low and gesticulating, hammering posts into the ground and running barbed wire along them, erecting a fence that ran right around the ranch in an enormous rectangle. The lights in the ranch were on. The wind howled and hurled sand over all and made the whole scene unreal.

'Jesus Christ!' Stanford said. 'Do you see that? They're being fenced in!'

'Damn them,' Epstein responded, surprised by the extent of his own rage. 'They won't get away with this.'

'They're carrying weapons and scanning the sky,' Stanford said. 'They must be looking for *something*.'

Epstein suddenly exploded, his throttled anger breaking loose; he smacked the palm of one hand with his fist and turned back to the car. The wind lashed him, tugged at him, tried to throw him to the ground, as he cursed and shouted against the storm.

'Damn them!' he shouted. 'They won't get away with this! We've been given the runaround too often, but the buck stops right here. I want to know about this, Stanford! I want to know about *all* of it! I want the Air Force

checked out. I want the facts on the CIA. I want to know what's been happening all these years and why they're keeping it secret. The Air Force say they're not involved. The CIA say the same. They're both lying and now we have the proof, so let's find out the truth. You understand, Stanford? It's time to stop playing around! I want to know what's been going on, I want the facts, not their fiction, and I want to take those facts and break them down and tear this whole thing apart!'

He stopped shouting and stared at Stanford. His friend was gazing up at the sky. Epstein suddenly realized that it was quiet, that the fierce wind was dying. Startled, he looked around him: the billowing sand was settling down, spiraling gently, drifting languidly on all sides in the stark, abrupt silence. Epstein couldn't believe it. He looked up at the sky. He saw the dust clouds thinning out, the moon and stars reappearing, the soft moonlight illuminating the flatlands and the parched, shivering trees.

Epstein stared down at the ranch. The dust no longer obscured the porch. The girl was standing there and sucking her thumb, gazing up at the sky. Everyone was gazing up. The soldiers had switched off the floodlights. They were standing around the house, clearly visible in the moonlight, neither moving nor making a sound, just staring up at the night sky.

'There they go,' Stanford said.

Epstein followed Stanford's gaze. He saw the three lights in the sky. They were very high up, very small, very bright, one of them the size of a dime, the other two even smaller. Epstein observed them, mesmerized. He felt Stanford's presence beside him. The lights formed a perfect triangle, climbing vertically, moving slowly, each composed of a luminous outer layer that surrounded a darker core. Epstein felt his heart pounding. He couldn't tear his eyes away. The two smaller lights changed, glowing brighter, accelerating, then they raced with a silent, serene grace toward the large light above them. The three lights merged together, became one, a brilliant star, then the star flared up and shot off to the south and disappeared almost instantly.

Stanford looked down at the ranch. He saw the girl on the porch. She was bathed in the moonlight, her dress fluttering against her legs, her feet bare, her thumb still in her mouth, her eyes fixed on the sky. Then she turned in his direction. She appeared to be staring directly at him. Stanford shivered and looked at Epstein, shivered again and shook his head, then they both

returned silently to the car and headed back toward Galveston.
‘I’ll find out,’ Stanford said.

Chapter Ten

Richard sat up straight in the hard wooden chair and stared nervously at the window beyond the desk. The desk was long and solid, its surface badly scarred, supporting a telephone and a couple of empty trays, all covered in dust. The window was equally dusty, one of its panes badly cracked, now vibrating from the traffic that inched along Tottenham Court Road, London. Richard sat there for five minutes. It seemed longer than that. He was still studying the window, watching the rain splash on the glass, when the door behind him suddenly opened and then slammed shut.

Richard jerked his head around, but the two men were already past him, moving around him and taking chairs behind the desk. They were middle-aged, one with black hair, the other bald, both wearing nondescript suits, shirts and ties, both with briefcases. The bald-headed man smiled at Richard, then opened his briefcase and removed some papers; he placed the papers fastidiously on the desk and then unclipped a ballpoint pen.

‘Awful weather,’ he said.

The other man seemed humorless, patting his hair with restless fingers, opening his briefcase and withdrawing a tape-recorder, which he set down before him. Only then did he look at Richard, his dark eyes expressionless, face sallow, chin badly shaved, now tapping the table with those same restless fingers.

‘Feeling all right?’ The bald-headed man asked.
‘Uh?’ Richard grunted.
‘I said, are you feeling all right? You seem rather tired.’ ‘Yes, I’m tired,’ Richard confessed. ‘I’ve had very little sleep. I

came yesterday to report seeing a UFO – and I’ve been here all night.’
‘Sorry about that,’ the bald-headed man said. ‘Must have been a bit uncomfortable. But the police can’t touch cases like this – they always have to call us.’

‘Who are you?’ Richard asked.

‘Data processors,’ the man replied. ‘We specialize in aeronautical phenomena and we work for the government.’
‘What department?’ Richard asked.
‘I don’t think that’s important. We’re just here to assess what you think you saw and write it up for the record.’
‘What I *think* I saw?’
‘Please don’t be offended. I’m not trying to insult you. But the sky is not as simple as it seems and it plays tricks with people.’
‘Such as?’
‘St. Elmo’s fire can turn a perfectly normal airplane into a bright, multicolored halo of twisting light. The planet Venus, when viewed under certain conditions, will appear as a glowing orb that moves in the most extraordinary patterns. Comets, meteors, balloons, satellites, flares, fireworks, noctilucent clouds, plasmoids and corona discharges can all look like bright, solid objects. For instance, a high altitude balloon, if struck at a low angle the rays of the setting sun, will resemble an enormous flying disk flying at tremendous speed. What will appear to the observer to be the blazing exhaust of the disk will actually be the swirl of dust and ice crystals left in the wake of the balloon and also reflecting the sunlight. Likewise with temperature inversions. These are various layers of air, all at different temperatures, which bend and twist and generally distort rays of light to create what is best termed a mirage. Did you know that a temperature layer can pick out a boat at sea, project it as a mirage in the sky, and that mirage will be viewed by an experienced pilot as a long, dark shape filled with illuminated windows? Similarly, somewhere in the country a long line of cars may be crawling up a hill, all beaming their headlights into the night sky; given the right kind of temperature inversion, those lights will be bent and sent traveling, will bounce off another temperature inversion thirty or forty miles away, and will appear to the observers as a mass of glowing, disk-shaped objects, all flying in perfect formation across the sky. As for plasmoids and ball lightning, both are basically formed by electrified gas that when burning brightly oscillates, vibrates, wobbles, flies horizontally, climbs vertically, glows in blue and red colors, and can look like a sphere or a disk or a gigantic torpedo; they also hum and make other strange sounds and are very impressive… Shall I continue?’

‘No,’ Richard said.
‘Good.’
‘I didn’t see any of those things.’
‘Possibly not. Let’s find out.’
The bald man smiled pleasantly and sat back in his chair, tapping his teeth with his ballpoint pen and nodding his head. The black-haired man lean forward, resting one hand on his tape-recorder, not smiling, speaking in clipped, measured rhythms, his dark eyes fixed on Richard.
‘The following questions have been designed to give the government as much information as possible concerning the unidentified aerial phenomenon that you’ve reported. Please try to answer the questions as accurately as possible. The information you give will be used for research purposes and will be regarded as confidential material. Your name will not be used in connection with any statements, conclusions or publications without your permission. Now please confirm that you understand and accept this.’
‘I do,’ Richard said.
The bald man moved his chair forward, leaning over the desk, his pen hovering just above his notepaper, preparing to write. The other man turned his tape-recorder on and then started the questioning.
‘When did you see the object?’
‘March seven.’
‘1974?’
‘Yes.’
‘Time?’
‘About thirty after eight.’
‘In the evening?’
‘Yes.’
The bald man was making annotations in a large, heavily lined form, filling in the blank spaces.
‘Where were you when you first saw the object?’
‘In a car.’
‘Location?’
‘Cornwall.’
‘Precisely.’
‘The A30 through Bodmin Moor. It was near King Arthur’s Hall. That’s between Bolventor and Bodmin. That’s all I can tell you.’

‘How long did you see the object?’
‘Pardon?’
‘The duration of the sighting.’
‘I dunno. A good five minutes, I think. I blanked out after that.’
‘You’re certain you saw it that long?’
‘I’m not certain of anything.’
‘Five minutes is a long time.’
‘A lot of things were happening. They couldn’t have taken place in under five minutes; it must have been at least that.’
‘What was the condition of the sky?’
‘I don’t know what you mean.’
‘Bright daylight? Dull daylight? Bright twilight? Just a trace of daylight? No trace of daylight? Don’t remember…?’
‘Deepening twilight. A vivid red sky. The sun was just sinking.’
‘Where was the sun located as you looked at the object?’
‘I don’t know. I can’t remember… Yes, it was behind the object. In fact, at first I thought the object was the sun. I thought the sun was exploding.’
‘It eclipsed the sun?’
‘Yes.’
‘What else did you notice concerning the sky?’
‘Sorry?’
‘The stars… None? A few? A lot? Can’t remember…?’
‘I can’t remember. There was just this silvery haze. I don’t think I saw stars.’
‘And the moon?’
‘I didn’t see it. There was just the silvery haze, then this faded and I saw the object. This object was so big, it seemed to block out the whole sky.’
‘The object was brighter than the background of the sky?’
‘Yes, it was at first. It was the brightest thing I’d ever seen. Then it darkened and lights flashed all around it and it blotted out the sky.’
‘How dark was the dark shape?’
‘I don’t know what you mean.’
‘Was it darker than the sky at that time?’
‘The sky was a vivid red. The object was dark.’
‘Did the object appear to stand still at any time?’
‘It came up over the rocks and then stopped, just hovering there in mid-air.’
‘Did it speed up and race away at any time?’

‘No, it just stayed there. It was enormous and it stayed there. It just hung there in the sky and then dropped lower and then opened up and we were – ’
‘Did it break up into separate parts or did it explode?’
‘Those questions are ridiculous. What happened was – ’
‘Please just answer the questions.’
‘No, it didn’t explode. It didn’t break up either. These panels opened and two other disks flew out and – ’
‘Did the object give off any smoke?’
‘There were *three* objects!’
‘Did the largest object give off any smoke?’
‘No, not that I noticed.’
‘The smaller objects?’
‘No. Definitely not.’
‘Why definite?’
‘They were close. They were right outside the car, one on either side of the car. They just drifted around the car, real slow, and I didn’t see smoke.’
‘Did any of the objects change shape?’
‘No. I mean, I’m not too sure of that. When I first saw the large object, it just looked like a light – a very bright explosion of light that filled the whole area. Then it changed to the dark shape. There were flashing lights all around it. I kept thinking it was changing its shape, but I think the lights made it look that way. It didn’t change as it rested there.’
‘Rested? On what?’
‘It was just floating in the air.’
‘How high up?’
‘I don’t know. It seemed about a hundred feet or so, but I can’t be too sure of that. Then it descended. It dropped almost to ground level. That’s when it opened up along the bottom and then drew us toward it.’ ‘Did the object flicker, throb or pulsate?’
‘It was just a sudden flaring light that faded away and was replaced by the dark shape.’
‘You mentioned various lights.’
‘That’s right. Colored lights. They were red, blue, green and orange, they stretched the whole length of the object, and they blinked on and off in sequence, from left to right, then right to left, flickering on and off very fast, almost turning into one rainbow color.’

‘Where were the lights positioned?’
‘I’m not sure about that. I think they were near the bottom of that thing. They may have gone right around it.’
‘You mean the object could have been circular? Disk-shaped?
‘Yes. Like the smaller objects. They were certainly disk-shaped.’
‘Did the large object move in front of anything at any time?’
‘I told you: the sun.’
‘Anything closer?’
‘It came over the nearby rocks and stopped in front of them. It just blotted them out.’
‘Rocks?’
‘The Neolithic stones.’
‘Did it move *behind* anything at any time?’
‘No.’
‘Did the object appear to be solid or transparent?’
‘Solid. Definitely solid.’
‘Were you wearing glasses or sunglasses?’
‘No.’
‘Did you observe the object through the windscreen or windows of the car?’
‘Yes.’
‘Did you roll the windows down at any time?’
‘No.’
‘Any reflections on the windscreen or windows?’
‘I don’t know.’
‘Did you view the object at any time through binoculars, a telescope, a theodolite or any other optical instrument?’
‘No. There was no need for that. It was practically on top of us.’
‘Did the object make any sound?’
‘I don’t know. I’m not sure. I think it made a kind of bass humming sound. At first I thought I heard an explosion, but now I don’t believe I did. I believe I *felt* something. It was a sort of vibration – a vibrating noise. I don’t know. I can’t answer that one. There was noise… A vibrating.’
‘The smaller disks?’
‘A humming sound. They sometimes made a whistling noise. When they whistled, they shot beams of light over us… I’ve never heard a sound like that before.’
The black-haired man sat back and turned the tape-recorder off while the

bald man pushed a sheet of blank paper at Richard and passed him a pencil.'

'I want you to draw some simple pictures that will show the general shape of the objects,' the bald man said. 'Label and include in your sketches any details of the objects that you recall, such as wings or other protrusions, including exhaust and vapor trails. Use arrows to indicate the direction the various objects were traveling. Also include in your drawings any motion that the objects made. Place an "A" at the beginning of the path, a "B" at the end of the path, and show any changes in direction during the course of their movements.'

Richard did as he was told. His hands were visibly shaking. The room was bitterly cold but he was sweating, and he felt slightly feverish. The two men watched him quietly. They never took their eyes off him. He heard the rain beating at the window just beyond their heads. He did the drawings quickly. They were neat, accurate sketches. He then pushed the paper back to the bald man, who studied it carefully.

'Good drawings,' he said.

'I'm an art student,' Richard said.

'Ah, yes, the Hornsey College of Art.'

'That's right,' Richard said.

The bald man passed the paper to his more serious companion, who studied it, passed it back, turned his tape-recorder on again, and then spoke directly to Richard.

'Okay. Were the edges of the large object fuzzy, blurred, or sharply outlined?'

'The smaller disks were sharply outlined. They were disk-shaped and silvery. I couldn't see the edges of the big one. Its flashing lights were too bright. The body was just a dark mass and the flashing lights rendered its edges invisible.'

'What length would you estimate the various objects to be?'

'Not length: diameter. The big one was about three hundred feet wide and at least several stories high. The smaller disks came in two sizes: the first two were about three feet in diameter, the second two, which came out later, appearing to draw the car forward, were about thirty-five or forty feet wide. The first two disks were completely solid, with no visible features. The second two had a perimeter that swept up to form a dome. The dome seemed made of something like glass or Perspex. I remember seeing figures

in there. And I didn't imagine that…'
'Never mind the occupants. What do you think the objects were made of?'
'Some sort of metal.'
'You used the word "silvery".'
'Silvery or metallic-gray.'
'What were you doing at the time you saw the first object, the big object, and how did you happen to notice it?'
'I was in the passenger seat of the car. The woman was driving. The engine spluttered and died, the headlights went out, then the car rolled to the bottom of the hill and came to a stop. Then I thought I heard something. I didn't hear it: I *felt* it. Then the car was filled with light – the whole area was flooded with light – and that light swept over the stones in the field nearby and materialized as the object.'
'What direction were you heading before the car stopped?'
'Southwest.'
'What direction were you looking toward when you first saw the object?'
'Toward the sinking sun. West.'
'Are you familiar with angular direction?'
'No.'
'What were the weather conditions at the time you first saw the object?'
'It had been raining most of the day, but the clouds were disappearing, and the sky was red but gradually turning dark. There was mist coming over the hills, but none around us.'
'There was no mist near the car when you were driving?' 'No.'
'Any mist during your encounter with the large object?' 'No. Just the white haze.'
'You're certain that this white haze wasn't mist?'
'Yes. It was light.'
'Wind?'
'I don't think so.'
'Temperature?'
'Pretty cold.'
'What was the approximate speed of the large object in flight?' 'I'm no good at judging speeds.'
'Roughly.'
'About thirty miles an hour.'
'*Thirty*?'

‘Yes.’
‘You know that’s theoretically impossible?’
‘Yes. It seems impossible, but that’s what it was doing. I mean, that thing was just… *drifting*.’
‘The smaller disks?’
‘I couldn’t say. They were fast. But they could also sit, or hover, in midair, just kind of drift around the car, or shoot off in the blinking of an eye. I couldn’t give you even an estimated speed.’
‘Can you give me an estimation of how far away the large object was from you?’
‘When it came down, it was about fifty yards from the car, give or take a few yards.’
‘Did it give off any heat?’
‘Yes, I think it did. I remember feeling hot and suffocated… but I *was* pretty frightened.’
‘Was this the first time you had seen an object, or objects, like this?’
‘Yes.’
‘Ever thought about them?’
‘Not much.’
‘Did anyone else see the objects?’
‘The woman driving the car.’
‘Apart from her.’
‘No.’
‘When did you first report this officially?’
‘Yesterday.’
‘Why did you wait so long?’
‘I was frightened.’
‘Frightened? Of what?’
‘I didn’t think anyone would believe me.’
‘Anything else?’
‘I was just frightened in general. I was frightened by what had happened. I couldn’t really believe it myself – I didn’t *want* to believe it. Also, I had nightmares. I kept dreaming about the incident. I thought maybe I was going a little crazy. I didn’t want to tell anyone.’
‘What did you dream about?’
‘I’m not sure. I could never recall the dreams clearly… Just dreams of the white haze, silhouettes all around me, alien creatures, not saying a word,

just crowding around me.'
The black-haired man nodded and switched his tape-recorder off while his bald friend pushed more paper toward Richard.
'I want you to draw the occupants,' he said.
'I can't remember their details,' Richard said.
'Just try,' the bald man said. 'Try to remember. Just give us some idea.'
Richard did as he was told, but his hands were shaking worse than ever. He was also sweating and the fear was returning as he drew the weird faces. It took him longer than before. He found it hard to concentrate. He heard the rain against the window, the steady breathing of the two men, and his heart was racing faster than normal, as if succumbing to panic. He finally finished the drawing. It looked childish and ridiculous. He pushed it back to the bald-headed man and watched him thoughtfully study it.
'A little Picasso,' the man said.
'That's what they looked like,' Richard said.
'Do you think they were wearing some kind of mask?'
'Yes, I do,' Richard said.
The bald man smiled at him, passed the drawing to his partner, and the other man studied it for some time before setting it down. He then looked directly at Richard, not smiling, and switched on his taperecorder.
'Is that nose supposed to be metal?'
'That's what it looked like,' Richard said.
'And a mask could account for the lack of lips?'
'That's right,' Richard said.
'Did the glass, or Perspex, dome distort their features?'
'I think so,' Richard said. 'I couldn't really see past their heads – that dome blurred the interior.'
'They stared at you?'
'Yes.'
'Did they make any gestures?'
'The creature in one of the disks raised his hand. It looked like a claw.'
'A metal claw?'
'Yes.'
'Any skin?'
'Gray and wrinkled. The skin around the eyes seemed wrinkled, but I can't be too sure of that.'
'Why?'

‘Like I said, the transparent dome distorted their features. It was transparent, in a frosted-glass kind of way. It had a rippling effect.’
‘What did you do when the creature raised its hand?’
‘That’s when I blanked out. A beam of light suddenly shot over me and I think that’s what did it.’
‘And then?’
‘I don’t think I was unconscious for very long. I think it was only a few seconds. I woke up and saw the big object coming down and blocking out my whole view. Then our car was drawn toward it. The car was dead, but it was moving. The thirty-five or forty-foot disks were at both sides of the car, shooting beams of light at the car and seeming to draw it forward.’
‘You say thirty-five or forty feet. That’s seems to me to be a fairly precise estimate.’
‘I know. I don’t know why I think that… But I always feel sure of it.’
‘Okay. Continue.’
‘That was it,’ Richard said. ‘We were pulled toward the big object. The colored lights flickered on and off, the ship seemed to split along the bottom, we were drawn all the way inside, saw a dazzling white light and silhouetted figures, and after that, I don’t remember a thing… I guess I just fainted.’
‘Not recovering until three days later.’
‘That’s right. About thirty miles away.’
‘And you’ve absolutely no idea how you got there?’
‘No. No idea.’
‘Have you ever suffered from amnesia?’
‘No, of course not.’
‘We can check on your medical records.’
‘You won’t find amnesia.’ Richard scratched at his beard, studying the two men in turn, wondering what they were thinking, feeling nervous again.
‘The police doctor,’ he said. ‘That guy examined my burnt neck. The cops said they would give you the report. What did it say?’
‘There was a burn mark all right. Unfortunately it was nearly gone by the time you were examined, so it’s impossible to say at this stage what caused it. Otherwise you’re unchanged.’
‘Unchanged?’
‘Your blood sample revealed nothing unusual.’
‘What did you expect to find?’ Richard asked.

‘Nothing,’ the man said. He switched the tape-recorder off, clasped his hands beneath his chin, tapped the fingers of both hands together and kept staring at Richard.
‘Well, what do you think?’ Richard asked.
‘What do you expect us to think?’
‘I want to know what really happened out there.’
‘I think you imagined it.’
‘Imagined it?’
‘Yes. Your story’s not credible,’ the man said. ‘I’m afraid the pieces don’t fit together. Your story doesn’t make sense.’
‘*What* doesn’t make sense?’
‘None of it,’ the man said. ‘Your experience can’t be real because such objects and such creatures simply don’t exist.’
‘But I *saw* them!’
‘You *think* you saw them. You possibly saw a mirage. You saw the reflection or an airplane or ship, caused by a temperature inversion.’
‘It was *real*!’
‘No, it wasn’t. It couldn’t have been real. No object that big can fly at thirty miles an hour and then hover without a sound above the ground. It’s scientifically impossible.’
‘*What’s* scientifically impossible? What the hell does *that* mean? All I know is that it *happened*, that it happened to *me*, and that I came here to get an explanation because that’s what I need.’
‘What can *we* explain?’ the man said. ‘Do you expect us to *confirm* it? Unidentified lights were can discuss, but what you saw is pure fantasy. It’s simply not possible. There’s no way we can accept it. Sadly, the facts speak for themselves: your whole story is nonsense.’
‘Oh, shit!’ Richard said.
‘Not shit – facts. Just one more question to ask and then we’re finished: Were you drunk when you saw it?’
‘Drunk?’
‘You heard me. I repeat the question: Were you drunk? According to the report you gave to the police, you were drinking that evening.’
‘Well, yes, but… ’
‘You were drunk.’
‘I don’t think that has relevance – ’
‘The woman herself said you drank a lot. In fact, she said you were

plastered.'
Richard straightened up again, suddenly feeling disorientated, recalling the gleaming white Audi and the woman with red hair and green eyes. That woman had disappeared. She was gone when he awakened. But she had been there and had shared the experience with him… This just didn't make sense.
'The woman?' Richard whispered.
'That's right: your driver. We located her at her home in St Nicholas and she told us her story. She remembered picking you up. She said you helped her fix her stalled car. She said that you drank a lot, that you became extremely drunk, and that she had to tip you out close to Bodmin when you became too offensive. She didn't see any UFOs. She saw nothing unusual. She said she dropped you off near Bodmin, that you were swaying from side to side, and that you staggered back the way you had come – heading straight back to Bodmin Moor. That's the last she saw of you. Her drive home was uneventful. In short, she experienced nothing unusual – and neither did you.'
'She's lying!' Richard shouted.
'I don't think so,' the man said. 'Why would she do that? I think you became extremely drunk, that you hitchhiked back to Dartmoor, that there you saw Venus or ball lightning or a mirage caused by a temperature inversion; and that in your drunken state you thought it was real and then you imagined the rest. It's not that uncommon. People see things all the time. In a drunken condition a natural occurrence can shock you and make you see what's not there. It was all in your head, lad.'
'You don't believe that,' Richard said.
'Yes, I do,' the man replied.
'Christ, mister, I'm telling you the truth!'
'Or what you *think* is the truth.'
Richard inwardly collapsed, feeling crushed and defeated, the fear rushing back to swallow him whole, leaving him senseless. The two men cleared the desk, snapping the locks on their briefcases, then they walked around Richard without a word and opened the door of the room. Richard jerked his head around and stared up at both the men. The black-haired man was leaving the room, but the bald man still stood there. Richard didn't know what to say. The walls were closing in on him. The bald man was just

standing there, smiling, as Richard stared up beseechingly.
‘Sonny,’ the bald man said with a smile, ‘you’d better see your psychiatrist.’

Chapter Eleven

Professor Vale was paralyzed. He knew this almost immediately. Opening his eyes, he flicked them left and right because his head wouldn’t move. The room was all white, shaped like a geodesic dome, its triangular plates made of aluminium, joined by thin, steel-gray tubing. The professor licked his dry lips. The paralysis didn’t bother him much. He felt dreamy and unreal, removed from himself, content just to lie there on the bed and let events take their course.

His eyes flicked left and right. The circular wall was white and featureless. The sole door was molded into the wall as if it couldn’t be opened. The professor was impressed. He had never seen a room like it. He gazed up at the bright, dome-shaped ceiling and saw two porthole windows. What they revealed was beautiful. Exotic fish were gliding past. The professor realized that he was deep in the ocean, probably down on the sea bed.

None of this bothered him. In fact, he found it interesting. He heard the breathing of someone nearby, but he couldn’t quite see them. This didn’t concern him: he would see them soon enough. He tried to move, but the paralysis was total, so he just lay there quietly. The whole room was quiet. There was a distant humming sound. He heard the breathing of the person nearby and tried turning his head. This time he could move it.

There was another bed in the room, about twelve feet away, made from shiny white plastic, its solid sides sweeping down to meet the floor, the rest of it seemingly molded to fit the body of the man sleeping upon it. This man was covered in a surgical gown and had a metallic skullcap on his head, with electrodes joining the skullcap to the various colored wires that ran back into a console behind the bed. The professor studied the man at length. The man appeared to be in a coma. There were straps around his ankles and wrists, with more wires dangling from them.

The room was shaped like a gigantic eggshell. The professor looked up at the ceiling. He saw exotic fish staring down through the portholes before disappearing in green murk. It was eerily beautiful. The silence was serene. The room's antiseptic whiteness, its seamless circular wall, gave it the appearance of an enormous sheltering womb and made him feel almost childlike.

The professor raised a hand to touch the hair on his head and felt his fingers scratching his scalp. He wasn't wearing a skullcap. The paralysis was fading. He wriggled his toes and felt the muscles in his legs and then he slowly sat upright. He felt dizzy and weak, his stomach nauseous and rumbling, but he took a deep breath and glanced about him and soon felt much better.

The other man was still unconscious, hardly moving, breathing evenly, his face lean and pasty, almost deathly, his chin in need of a shave. The professor studied the strange bed. It was molded out of the floor. Thrusting out from the wall behind it, looming over the bed itself, was a until containing lamps and plasma jars and an X-ray camera, this whole unit also molded with sensual grace from the shiny white plastic.

The professor gazed around the room. The shining whiteness stung his eyes. He glanced up and saw the fish at the portholes and then remembered the boat… The sea had turned to green steam. The metal jaws had closed above him. The metal jaws had become a giant version of the room now surrounding him… The professor was fascinated. He understood that he was drugged. He swung his legs off the bed, placed his bare feet on the floor, then stood upright, swaying slightly from side to side, making sure he was strong enough.

The floor wasn't moving. It didn't sway or vibrate. It appeared to be made of fibre-glass and was comfortably warm. The professor wondered where he was, wondered what was expected of him; he no longer felt in charge of himself and wanted someone to guide him.

The humming sound came from a distance. He thought it came from beyond the door. The door had no visible handle, no keyhole or lock, but when the professor approached it and touched it, it slid open silently, sliding

into the wall. The professor just stood there. He kept rubbing his eyes. He tried to tear himself from what he was looking at, but he couldn't escape from it.

He was looking along a corridor that curved gently out of view, its walls shaped like a tunnel, gleaming brightly, broken up with large windows. These windows were rectangular, revealing the ocean bed, beams of light boring through the murky depths, illuminating an aquatic wonderland.

The professor advanced into the corridor, gazed through the nearest window, saw smooth rocks and multicolored plants and bizarre, swimming creatures. It was awesome, incredible, the flooded landscape of a dream: the fish monstrous and minute, stunningly beautiful and grotesque – pulsing gills, flapping fins, eyes like prisms and stars, their colors changing as they merged with one another and formed wavering rainbows. The ocean bed was stone and sand and had a fathomless mystery; the sand swept out and drifted around the rocks which were alive with primordial life. The professor almost stopped breathing. He was stunned by what was out there. He saw a huge uncoiling eel, a web of glistening, writhing tentacles, a gelatinous mass of gold, green and violet sniffing at shrinking, possibly carnivorous plants. He saw it all in the beams of light. The lamps were fixed outside the windows. The beams of light were the only illumination in those dark, vitreous depths.

The professor advanced along the corridor. The floor warmed his bare feet. He was still wearing his flowered shirt and shorts, and that worried him slightly. How long had he been down here? Had he slept for hours or days? The questions flickered through his mind and then departed without having quite touched him. He felt only curiosity, an overwhelming sense of awe, obsessed with the need to go farther and make contact with someone. He didn't question this desire: the need itself was enough. He kept walking, passing more windows and the ocean's teeming life, and the corridor kept curving away from him in what seemed like a circle.

The humming sound grew louder. There was a rhythmic vibration. The professor arrived at an open door on the inside of the corridor, and stopped there, momentarily transfixed, before stepping up to it. The noise here was

much louder and had a hollow, echoing tone. He looked through to an immense geodesic dome filled with catwalks and ladders.

The professor stood there for a long time. He remembered seeing all this before. He glanced up at the silvery-gray dome and remembered it closing. Then he looked down again, saw the catwalks and ladders. There were glittering floors and platforms, modules made from steel and glass, mazes of shining pipes and generators, arc lights blazing from white walls. There were people down there, faraway, looking tiny, all dressed in coveralls, climbing ladders, crossing catwalks, moving up and down those dizzying depths in elevators like cages. The professor stepped up to the door. It hissed angrily and slammed shut. He touched it, but it didn't open again, so he shrugged and walked on.

He was amazed but not frightened. He understood that he was drugged. This knowledge filled him with a distant, dry amusement that didn't quite come to life. The corridor stretched out before him, kept curving away from him. He passed more windows looking out on the murky depths and then he came to another open door. He tried to step through it, but it slammed shut in his face. Shrugging again, he turned away, feeling calm, unperturbed, understanding that he had to keep walking and that the closed doors were guiding him.

Eventually he reached the end of the corridor and found himself outside a large, white-painted room. Stepping into the room, he surveyed it with almost clinical detachment. The room was circular and dim, without windows, quite cold, lots of beds placed equidistant from each other, positioned all the way around the room and melting into the floor. All the beds were occupied, filled with men, women and children; they were all lying quietly, wrapped in surgical gowns, wires running from electrodes in their heads, hands and legs, coiling up to the ECG monitors that were fixed to the wall. The regular breathing of the people on the beds was surprisingly loud in the silence.

The professor shivered briefly. He wasn't frightened, but he felt peculiar. He walked across to the far side of the room and passed through to another room.

This room was also circular, but much bigger and brighter, its walls lined with glass cabinets and winking digital control panels, with two prop-up surgical beds, surrounded by tall equipment units, positioned in the center of the floor, their headrests raised slightly. There was a dwarf at one of the beds, his spine bent, his legs twisted; he was wearing a white gown, working swiftly and silently, his unusually pale and delicate hands flipping back a white sheet.

'Where am I?' Professor Vale asked. 'Who are you? Where's Mr McKinley?'
The dwarf finished his job, unconcerned, working lovingly, then he turned and stared up at Vale with large, slightly glazed eyes. He then sniffed and scratched his ear, shuffled forward laboriously, his head rolling loosely from side to side, buried between his raised shoulders.
'Ah,' he said, 'you're awake!'
'Where am I?' Vale asked.
'We were expecting you,' the dwarf said.
'Who are you?'
'I stayed here. I was waiting.'
'Where's Mr McKinley?'
The dwarf nodded agreeably, his head rolling from side to side, then he went to what looked like a dentist's chair and raised the headrest. Vale studied the glass cabinets, which were about six feet long, all of them containing a naked human, either unconscious or dead. The glass was lightly frosted. The control monitors were flickering. Vale realized that they were cardiograph and ECG readouts, and that the people in the cabinets were still alive. He returned his gaze to the crippled dwarf, who was grinning inanely, waving him forward. Vale stepped over to the chair and sat in it without asking himself why he had done so.
'You are comfortable?' the dwarf enquired.
'Yes,' Vale said.
'No fear,' the dwarf said. 'Fear is foolish.'
'Where's Mr McKinley?'
The dwarf nodded his understanding. 'Mr Wilson comes soon,' he said. 'I press a button to call Mr Wilson, and then your fear… fear is over.'
Vale remained in the chair, studying the dwarf, intrigued by him, watched him shuffling across the floor and pressing a red button that was fixed to the

wall. The dwarf grinned at him and nodded, then shuffled along to one of the cabinets, pressed his nose to a pane of frosted glass and stared at a naked man. The man appeared to be dead, but the readouts confirmed that he was alive. The dwarf turned away from the cabinet and returned to Vale. He looked curiously at Vale, his eyes large and slightly glazed, then grinned inanely and pointed to a spot just above Vale's head.

Raising his gaze, Vale saw a circular white canopy. Sunken into the face of the canopy were surgical lamps and convex lenses, surrounding a stereotaxic skullcap and loosely dangling electrodes. Vale studied the canopy. It also housed an X-ray camera. He studied the electrodes and the skullcap, then he looked at the dwarf.

'Who are you?'

'I wait here.'

'Who *are* you?'

'I work good.' The dwarf grinned and waved his delicate hands, 'No need for fear… fear is over soon.'

Vale looked up at the domed ceiling of the room. It seemed to shine with natural light. Feeling unreal, but not at all frightened, he looked back at the dwarf. The pathetic creature was still grinning. His hands clashed with the rest of him. Compared to the crippled legs and the bent, distorted spine, the unusually pale and delicate hands might well have belonged to someone else. The dwarf grinned and nodded repeatedly, pointing excitedly to the nearby doorway. Vale looked up as McKinley walked in, his blue eyes clear and steady.

'I'm Wilson,' he said.

'I thought you were McKinley.'

'McKinley came to an unfortunate end. I am Wilson. Remember that.'

Wilson looked neat and cool, his shirt and trousers a matching black, outlined against the white of the circular room, a slight smile on his face. Vale remained in his chair, again wondering why he didn't feel fearful. Then he remembered his belief that he'd been drugged. As if to confirm this, Wilson took a step forward, leaned over Vale, placed his thumb on Vale's eyelid, pressed the eyelid upward, looked intently into Vale's eye, then removed his thumb and stepped back.

'You find this interesting?' he asked.

'Yes,' Vale said without thinking.

'And you don't feel any fear?'

‘I don’t think so,’
‘Well, that’s as it should be.’
Vale glanced around him, at the white walls and naked people in the frosted glass cabinets. He still didn’t feel any fear. Only an academic curiosity.
‘Was I drugged?’
‘Of course.’
‘I don’t really feel much different.’
‘You *are* different. The fact that you don’t feel any fear should be enough to confirm it. Think about it, professor. What you’ve just been through would normally have terrified you, but you’re behaving as if untouched by it. Think of what happened on my boat. Think of where you woke up. Think of what you saw as you walked to here and why you’re still not fearful. Of *course* you were drugged. Otherwise you would be mad. Even now, as you sit there, you’re still drugged, which is why you’re so calm.’
‘What kind of drug is it?’
‘More advanced than any you know. Scientifically and medically, the world you inhabited is antiquated. You will soon find that out.’
Wilson crossed to the glass cabinets and waved languidly at them. ‘Observe,’ he said, ‘the wonders of our science. They will sleep till I waken them.’ Turning around, he looked down at the dwarf, who was grinning and nodding excitedly. Wilson patted the dwarf lightly on the head and then offered a bleak smile. ‘This is Ruediger,’ he said. ‘He has wonderful hands. We removed his hands and gave him metal claws and then we gave his hands back to him. Of course they’re not his old hands. In fact, they’re not flesh and blood. Nevertheless, they are as good as the originals, and the patient is happy.’ He returned to Professor Vale, leaned close to him, stared at him. ‘And you still don’t feel any fear?’ he asked.
‘No, I don’t. I don’t think so.’
Wilson smiled and straightened up, then returned to the glass cabinets against the wall and indicated the bodies. ‘They’re all alive,’ he said, ‘though we’re killing them slowly. We want to preserve them for the future, so they’ll have to die gently. We will drain all their blood, then replace the blood with glycerine and dimethylsulfoxide to prevent ice crystals forming in their tissues. Then we’ll wrap them in aluminium foil, place them in cryonic storage chambers , and only resurrect them when we need them.’
Turning away from the cabinets, he walked back across the room, leaned once more over Vale and offered his bleak smile. ‘And you *still* feel no

fear?' he asked.
Vale glanced around the room to see the smooth, circular wall, the solid geodesic dome that shone brightly above him. Then he studied the cabinets. The frosted glass distorted the naked bodies. The jagged white lines jumped erratically just above them, moving slower each second, indicating that the bodily functions of those still living were gradually running down. Then Vale looked up at Wilson, taking in the cold, intelligent eyes, the tanned, strangely unlined forehead under the shock of white hair.
'Who are you?' he asked.
'I've just told you: I'm Wilson.'
'Where do you come from?' Vale asked.
'You'll learn that when you need to.'
'And the bodies in the cabinets?'
'What about them?'
'Where do they come from?'
'From Earth,' Wilson said. 'From all over. We picked them up from here and there.'
'I'm not frightened,' Vale said.
'No. You're still drugged.'
'What do you want from me?' Vale asked.
'I want your brain,' Wilson said.
Professor Vale felt nothing. He was numbed to rational feelings. He just sat there, staring around the strange room, wondering just where he was. He remembered the triangular steel spikes, rising inexorably, closing above him; recalled sinking through a shimmering white haze, past steel catwalks and ladders. All of that and much more: his long walk along the curving corridor, the large windows, the ocean bed, the great dome that soared above the immense decks and workshops, dwarfing the men in the modules of steel and glass, reverberating with the sounds of ceaseless activity. He was at the bottom of the ocean. This room was part of something enormous. He was possibly in an undersea city, but he couldn't be sure of that.
'Put your head back,' Wilson said.
'Pardon?'
'Put your head back. I want to place this skullcap on your head. This won't take very long.'
Vale did as he was told. Wilson pulled the skullcap down. Vale felt the cold metal against his scalp, and then he felt a slight pressure.

‘You don’t have to shave my head?’
‘No, my dear professor. We’re not as primitive as that. We bypassed all that long ago. This operation is simple.’
Wilson adjusted the skullcap. It tightened around Vale’s head. Raising his eyes, Vale saw a tangle of electrodes dangling down just in front of him. A pair of hands came into view, unusually pale and delicate; the crippled dwarf was leaning over his shoulder to insert the electrodes. Vale didn’t move. He was surprised by his own serenity. He knew that what was happening was a nightmare, but it was happening outside of him. The dwarf inserted the electrodes. There was a faint ringing sound. Vale tried to raise his hands to his head but found them strapped to the armrest. His hands and forearms tingled. The chair’s arms were vibrating. Vale sat there, unable to move a muscle, reconciled to his fate.
‘No fear,’ the dwarf said. ‘Fear is over… No fear in your future.’
Vale couldn’t see the dwarf. Clearly the dwarf was still behind him. Wilson was standing directly in front of him, a bleak smile on his face.
‘In 1932,’ he said, ‘Dr Walter Hess devised the modern technique of electrode implantation, thereby demonstrating that nearly all of man’s functions and emotions can be influenced by stimulation of specific areas of the brain. A state of constant drowsiness can be brought about by the simple electric stimulation of the caudate nucleus, the nucleus reticularis, or the inferior thalamus; conversely, a similar stimulation of the mesencephalic reticular formation will induce instant arousal. Man is thus a machine, to be utilized, controlled, operable by simple laws of give and take, without will of his own. The philosopher’s stone has been shattered. Philosophy itself has become redundant. The mysteries of the human mind, its creativity, its moral imperatives, have been reduced to a set of components that we endlessly play with. Man is not a magical creature – he is merely a container of various impulses. These impulses can be rearranged to a pattern that will change his behaviour.’
Wilson flicked a switch, bathing Vale in blinding light, filling his head with an unusual incandescence and making it vibrate. Though Vale felt himself blinking repeatedly, he could not resist. He understood that what was happening was hideous, yet he still felt no fear. Drifting out of himself, he observed himself succumbing quietly, his head trapped in the stereotaxic skullcap, beyond which there was nothing.
‘The hypothalamus,’ Wilson continued, ‘is the area of the brain that controls

your most basic and primitive needs. By stimulating the appropriate areas of the hypothalamus with submicroelectrodes I can regulate your blood pressure, your heart rate and respiration; your sleep, your appetite, even the diameter of your eye pupils; I can place you in suspended animation or make you work till you drop… Do you understand this?
'Yes,' Vale said.
'Excellent,' Wilson said. 'Now the rather simple biocybernetic system into which you are now plugged consists of a fifteen-channel programmable brain stimulator and a normal LINC-8 digital computer with the appropriate interfacing equipment. At the moment, radiopaque materials are being injected into the intracerebral spaces inside your skull to facilitate, by X-ray, the visualization of various parts of your brain. The stereotaxic skullcap, utilizing minute spikes that have already pierced your scalp, is now taking the X-rays from a variety of different angles. At this very moment the stereotaxic apparatus is making geometrical calculations using the X-rays and reference-point grids to give me three-dimensional coordinates for the positioning of the electrodes… You will feel none of this.'
Vale sat quietly in the chair, his eyes closed in surrender. His whole head was vibrating, was glowing and warm, and he felt that he was crouched up in there, his own skull surrounding him. It made him think of the great dome. His own skull was such a dome. It was immense and he was crouched at its center… overwhelmed by the vast, empty darkness.
'The desired targets have been fixed. I am drilling into your skull. The steel electrodes are as thin as hairs, the micromanipulators are guiding them in, and in a moment you will feel an electric current as light as a feather. You will not feel any pain. You will experience a brief panic. This panic will pass away quickly, after which you'll feeling nothing… I am taking your brain now.'
Vale sat very still, almost welcoming what was coming. His eyes were closed and he crouched in a darkness lit by tiny flashes of light. His brain's interior was enormous. He actually thought he could see it. It was an immense, crenellated, dark dome rising up all around him. There was silence. A bass humming. A distant rumbling reverberated. He crouched alone in the wilderness of his mind and saw the holes in the sky. That sky was utterly black. The holes appeared as tunnels of light. The light burned through the curtain of darkness and exploded around him.

Vale shrank within himself, feeling helpless, totally naked, now whipped by a sudden, shocking terror that returned him to childhood. Then he heard his own voice, a strangled sound, hoarse and pitiful, gasping out its anguished plea for release, its final expression of will:
'Please don't,' he whimpered.
It didn't matter after that. The fear passed and he was calm. The light receded and he saw the dark walls of his captured, chained mind. There was a glowing in the darkness: the light of mindless peace. The walls retreated and dissolved all around him as he opened his eyes. He saw the radiant white room, the grinning dwarf, the glass cabinets, a seamless face staring at him, the cold blue eyes reflecting him.
'I'm not from ACASS,' Wilson said. 'Mr McKinley was from ACASS. Mr McKinley wanted to hire you for his project, but we need you more. We need people everywhere. We have to know what's going on. We need someone in the Cheyenne Mountain Complex, and you are that person. You will do what we tell you, without question, without fear; you will do it because you won't have a choice, because you'll feel that you want to. Your will is our will. What we will, you will do. You will live just for service, and that service will be to us – and in performing that service you will experience the most complete satisfaction.'
'I understand,' Vale said.
'Good,' Wilson said. 'Understanding is enough. We will now take you back to Miami and deposit you there. You will return to your hotel room and have a sleep and awaken refreshed. You will not go to see McKinley. McKinley is dead. You will continue your vacation as before, as if nothing has happened. You will then return home. As usual, you will go to work. You will renew your contract with USAF, continue your work in the Cheyenne Mountain Complex, and then do whatever your head tells to do, without fear or regret. You are not responsible for your actions. Your will is our will. You will do what we tell you to do and through that know contentment. Now stand up, professor.'
Professor Vale stood up. He surveyed the circular room. The white walls and the naked bodies in the cabinets now offered him comfort. When he looked at Mr Wilson, he felt a warm, transcendent peace. The blue eyes of Mr Wilson were his will and he felt a great freedom. The crippled dwarf shuffled toward him, head rolling, hands outstretched; Professor Vale saw the hands, pale and beautiful, waving him forward.

‘Can I go now?’ Vale asked.
‘We’ll take you back,’ Wilson said.
‘I feel pretty tired,’ Vale said. ‘I think I need a good sleep.’
The dwarf left the room first, his legs jerking mechanically, leading Vale into another white-walled corridor that curved out of view. Wilson followed Vale, moving slowly and carefully. They all went along the corridor, past blank walls, in silence, eventually arriving at a high, narrow door that led into another room.
‘We’ll wait here,’ Wilson said.
The dwarf nodded, shuffled away and stopped in front of a closed door. Vale recognized it as the door of an elevator. The dwarf pressed a button. When Wilson pointed to a chair placed beside the elevator, Vale took the chair without a word.
‘It won’t take long,’ Wilson said.
Vale gazed around the room. It was white and rectangular. One whole wall was a sheet of convex glass that looked out on the ocean bed. Bright lights beamed into the murk, streams of green and silver shimmered, shoals of transparent fish and giant squid and monstrous eels swam back and forth as if in slow motion, colors glinting and merging. It was a scene of unearthly beauty. Vale thought it was wonderful. He saw bulging eyes, bizarre fins and rainbow scales, teeth that gleamed like polished razors in jaws as round and smooth as the rocks. The sand formed extraordinary patterns, tiny stones flashed like diamonds, the rocks alluvial, sensual, starkly shadowed, mysterious, alive with a minute, primordial life that defied description. It was all too much for Vale; he let his gaze cleave to the walls. The walls were white and had a pure, glacial sheen only stained by his shadow. He turned his head to glance behind him. Another window displayed the great dome. Below the dome were canyons of glass, steel and plastic: that materialization of a science beyond normal reckoning. Professor Vale felt close to tears, wanting to never leave this place. He turned again and looked directly at Wilson and knew what he must do.
‘You understand?’ Wilson asked.
‘Yes,’ Professor Vale said.
‘Your work will be important. Most valuable. You will always be warmed by that knowledge.’
‘I understand,’ Vale said.
‘Understanding is enough. We will always be with you to guide you. What

we need, you will get for us.'
'I understand,' Vale said.
The elevator door opened. Wilson motioned with one hand. Vale stood up and felt a great peace as he stepped inside. Wilson fell in behind him. The steel walls shone like glass. The door closed and the elevator descended, dropping smoothly and silently. Vale studied his own reflection, saw his shadow on polished steel; he felt calm and alert and in control, and out of this sprang his pleasure. Wilson offered him a smile. Vale filled up with pride. The doors opened and he followed Wilson out and saw the high, curving walls.
'This is a wonderful place,' he said.
'I'm glad you like it,' Wilson said.
'I hope I can come back here some day.'
'You will,' Wilson said.
The steel floor was enormous, the dome sweeping up high and overhead. Around the walls, scaling dizzying heights, were the catwalks and ladders. Hidden lights cast long shadows, modules piled upon other modules; there were enormous generators and pumps and miles of crisscrossing pipes. Most of the workers seemed faraway and wore different colored coveralls, moved up and down ladders, crossed the catwalks and balconies, and were silhouetted behind the long windows that glowed orange and blue. All of this was bathed in the white haze. Vale's shadow was stark. He looked straight ahead, across the immense lower floor, and saw Wilson's boat on the platform.
'That's some boat,' Vale said.
'Yes, it is,' Wilson said.
'If you meant to impress me, you've succeeded.'
'We always do,' Wilson said.
They walked across the steel floor, their footsteps ringing with a hollow sound, eventually stopping at the platform that was raised off the floor on hydraulic supports. Vale looked up at the boat and saw the crew hard at work. The domed roof was high above, a monstrous jigsaw of shadow and light, and the large boat seemed small beneath it, isolated in open space. The crewmen working in silence looked vaguely Oriental. The crippled dwarf was at the top of the ramp that ran down to the floor.
'After you,' Wilson said.
Vale made his way up the ramp and stepped onto the deck, the dwarf

reaching out and touching his wrist and then shuffling away again. Now on the platform, Vale leaned on the railing and glanced back over his shoulder. He saw Wilson coming up the ramp, stepping onto the platform, then hurrying across the rectangular entrance to the vast working space. In there, the light glinted off the modules, off the ladders and catwalks, then fused and became a white haze that spread across the machinery. Vale thought it was beautiful. He didn't really want to leave. Turning around, he saw Fallaci, still dressed in his white suit, leaning casually against a white-painted bulwark while talking to Wilson.

Someone tugged at Vale's trousers. He glanced down and saw the dwarf. The pitiful creature was grinning at him, head bobbing, hands waving.

'You feel good?' the dwarf asked. 'You feel better? No fear for your future?'

'No fear,' Vale said.

Wilson came up to him. 'We're going up now,' he said. 'You won't feel anything until we reach the surface, then the boat may rock slightly. Hold on to the railing.'

Vale did as he was told. It seemed a natural thing to do. He felt a slight vibration, heard a muffled droning noise, then the steel platform under the boat began to rise, moving up toward the domed roof. Vale glanced around him, saw the ladders and catwalks, felt a sudden, immeasurable loss as it all fell away from him. The steel platform kept rising, the boat rocking imperceptibly. Vale glanced below, at the workshops and modules, and wished that he could stay here forever to explore all these wonders.

'Hold on now,' Wilson said.

The platform stopped rising, its silence broken by muffled rumbling. The noise came from the encircling wall of the great dome, reverberating like distant drums. Vale knew it was the sea. The dome was nearing the surface. He had a final look around him, saw that technological marvel, then put his head back and stared above him at the shadow-streaked metal dome.

There was a sudden roaring sound, an insane hammering and hissing, as the sea exploded around the surfacing dome and rushed down its curved outer wall. Vale held on to the railing. The boat rocked from side to side. The dome seemed to sway above him, then it steadied, reverberating with hollow sounds.

Vale kept looking up, the roof of the dome still high above him, and saw thin lines of light, becoming brighter, growing longer, spreading out like the

ribs of a giant umbrella to expose the vivid sky. Vale was enthralled. He stared up in deepening wonder. The dome was splitting into its separate parts, becoming four huge triangles, then the triangles themselves split in two and moved away from each other.
A shocking brightness poured into the open dome. The light was like an exploding nova. The striations blazed down around the boat and swept out through the gloom. Vale felt the burning sun, saw the vast arch of the sky. The immense, sun-reflecting, triangular walls were sinking all around him. Then he saw the hazed horizon, the shimmering sheet of the sky above. The sea boiled around the circle of sinking steel fins, then it swallowed them totally, poured across the broad steel deck, and soon the deck was nothing more than a black mass below the turbulent waves. There was a brief, hollow ringing, the boat rocked and steadied, then the black mass sank deeper, grew smaller, disappeared, and then the boat was drifting lazily in the sea, which rippled gently on all sides.
Professor Vale stared around him. The sea was calm and sunlit. Green waves rolled away to the horizon and a thin wedge of land. It was the coastline of Miami. The boat was heading straight toward it. The crewmen were moving back and forth, working silently at their tasks, the late afternoon sun beating down, flashing off steel and brass.
Vale leaned against the railing and saw Fallaci near the cabin. The dwarf had disappeared somewhere inside, but Mr Wilson was still there. Vale felt good about that. He was very fond of Wilson. Smiling, Vale leaned on the railing and took in the fresh air.
Wilson finally approached him. There was a waiter by his side. Wilson smiled thinly and nodded while the waiter bowed low.
‘What would you like to drink?’ Wilson asked.
‘Rum and coke,’ Vale said.

Chapter Twelve

The dream of the Thousand Year Reich had all the grandeur of lunacy. Nothing was impossible. They firmly believed that. They had their Volkish socialism, their lust for an Aryan Utopia, and with the passion of all mad visionaries they stepped forth to create it. Mysticism? Yes. The Reich was born from mysticism: the Cosmic Circle of Munich, the Anthroposophy of Rudolf Steiner, the Theosophy and Rosicrucianism of Vienna and Prague,

the ancient myths of Atlantis and Lemuria, of the undefiled German. Mysticism and racism: the 'pure' blood decreed by Schuler. The Third Reich sprang out of a vision of a Utopia devoid of Jews and subhumans.

Such dreams have no limits. Ordinary logic cannot contain them. In such dreams the Third Reich saw the light over limitless vistas – and ignored the impossible. The whole world would be changed. Cities and nations would be erased. The Earth would be cleansed of Jews and subhumans and other vermin; and in isolated colonies, in new cities of stone and glass, a chosen hierarchy of masters and slaves would create the New Order.

No doubt they were madmen. Their strongest leaders were demented. They were men who lived their dreams, who were divorced from reality, who like children felt that all things were possible and that nothing could stop them.

Science is logic. Mysticism is the opposite. I despised the mysticism of the Nazis, but could see its potential. My own dreams were grandiose. No democracy could afford them. I needed money and equipment and labour on a staggering scale. No democracy would sanction it. Only lunatics would. And the lunatics, all those mad visionaries, were the Reich's leading lights.

I knew this when I met Himmler. It was in 1935. Behind his glasses his eyes had the mildness of a priest or a fool. We were in his office in Berlin. I spread my drawings out on his desk. He glanced at them and stroked his thinning dark hair and touched his nose with one finger. He had once been a chicken farmer. Now he headed the SS. A mild and modest killer, puritanical, quietly spoken, he was seeking to resurrect Atlantis through a Reich filled with supermen. I had checked him out beforehand. What I learnt was enough for me. He believed in mesmerizm, in reincarnation and clairvoyance, in Horbinger's cosmic world of ice and fire, in gods and godmen. His SS was a religious order. His men were bound by blood and oath. Himmler wanted to isolate them, to brainwash them and remold them, to mate them with the purest German women and produce blond perfection. He had once processed chickens; now he wanted to process people: he had a dream of a disciplined Order of masters and slaves. I wanted a similar Order

– but one devoted to science. And when Himmler raised his eyes from my drawings I knew I could have it.

Himmler checked me out thoroughly. He couldn't believe what I was there for. He first thought me an eccentric American who ought to be shot. I was held prisoner in Berlin. They interrogated me for months. In the Gestapo prison, in the Prinz Albrechtstrasse, I heard the screams of the tortured. My own interrogations were more casual. My cell was quite comfortable. They fed me and supplied me with books and let me work on my notes. The interrogations were conversational. The less fortunate continued screaming. For two months I kept repeating my history as they jotted down details. The prison was always busy. Bleeding unfortunates were dragged down corridors. I told my questioners of the project in Iowa and of how I had sabotaged it. The Americans don't know, I said. They believe the project was a disaster. My questioners tapped their pencils on the table and smiled at each other. Quite often I heard gunfire. It always came from the basement. I saw soldiers carrying bodies wrapped in shrouds and putting them into trucks. Such scenes did not disturb me. My hopes lived on undiminished. After two months, they concentrated on my drawings, still unsure of their value. I don't know who first studied them. I think the Italian, Belluzzo. Nevertheless, I was released shortly after and taken back to see Himmler.

No point in even dwelling on the blood that had stained Himmler's hands. Such a quiet man he was. His good manners were impressive. A modest face with round glasses, his hair thinning and neatly parted, he sat behind his desk like a minor clerk offering assistance. He asked me what I wanted. I explained my requirements. He nodded in a slow, thoughtful manner, sometimes stroking his nose. We are very impressed, he said. Indeed, he added, we are astonished. He then told me that some technical advisors had thought my drawings miraculous.

I asked who these men were. He mentioned Belluzzo and Schriever. He said Belluzzo was getting too old, but that Schriever was brilliant. They wished to work on my project. Himmler thought it a good idea. I realized that he wanted to have me watched, but I nodded agreement. You are committed, he said. You must now bend to our will. You will never return to your own

country; if you try, we will kill you. I reassured him immediately. I would report directly to him. My beloved project would be wrapped in strict secrecy and controlled by the SS.

I will never forget that day. My dream came alive then. Even now, the pain biting, my poor liver in disarray, I gaze out upon the glinting ice caps and remember it vividly.

I was driven to Kummersdorft West, sixty miles south of Berlin. We both sat in the rear of the car and looked out at the city. Himmler obviously loved Berlin. The sunlight flashed off his glasses. He stroked his nose and pointed out the sights with a clear, quiet excitement. The city was indeed majestic. The streets were filled with contented people. The walls were decorated with swastikas and flags and obscene propaganda. The word 'Juden' was prominent. I saw few on the pavements. Soldiers sauntered up and down and laughed heartily, in love with themselves. The very air seemed to smile. It was the triumph of the will. In its own perverted way it was the proof of Man's awesome potential.

Perverted? Most certainly. With that truth I could live. Behind those walls were the high priests of a demoniac Order: Hermann Goering, Josef Goebbels, Rudollp Hess, Martin Bormann – alcoholics, drug addicts, occultists and degenerates – the very epitome of that gross irrationalism that I so much abhorred. There, too, the Gestapo butchers, the drilled ranks of the SS, and all the torture and murder that went on every day in the basements.

Yet I had to accept it. Science cannot moralize. Those irrational brutes were no more than the means to achieving my ends. Progress needs its trampled bones. Death gives way to more life. Evolution knows neither right nor wrong and transcends transient matters. So, I would work with them. In doing so, I could use them. And looking out upon Berlin, glancing sideways at Himmler, I felt nothing but hope for the future, the glow of fulfilment.

We drove out of the city. Aircraft roared overhead. Sitting beside me, very stiff and upright, Himmler started to talk. He was suddenly like a child. His eyes gleamed behind the glasses. The words poured out and splashed upon my ears as if they couldn't be stopped. He said the rocket teams had left.

They had been moved to Peenemünde. The research center of Kummersdorft was empty and now it was mine. We passed troops on the road. The tanks growled through billowing dust. Himmler talked of Aryan blood and German might, of the world of the future. We will cleanse the Earth, he said. We will purify the blood. We will exterminate the Jews and the infirm and maladjusted, use the lesser races as slaves to the Reich, create a race of pure Nordics. There was no need to reply. Right or wrong did not concern me. When Himmler talked of his New Order, of his masters and slaves, I had the feeling that it just might succeed and that I could utilize it.

Unlimited labor was what I needed. No democracy could supply it. But here, in this country where all freedom had been suppressed, where the will of the people was one will – the Volk – and where discipline and slavery went hand in hand – here, at the dawn of the new era, I could do the impossible. Yes, I grabbed at it. I was in my late fifties. I thought then, before I knew what could be done, that my time was too short. Thus, I didn't moralize. Not then and not now. I looked out at the aircraft, at the tanks and machine-gun carriers, at the troops who were numbered in their thousands, and accepted it gladly.

History will exonerate me. What I did, I did for progress. I sit now in my mountain lair, the frozen wilderness below me, and I know with the certainty of faith that my life has meant something. I am changing the course of history. I am aiding evolution. When I die, as I now know I must, my achievements will live on.

I knew this at the time. The sight of the proving range convinced me. The experimental station was between two artillery ranges, safely isolated from the surrounding towns and villages, all the hangars in good shape. Here Wernher von Braun had worked. And Walter Dornberger and Klaus Riedel. Those names, and those of Grottrup and Becker, made me smile condescendingly. The A-3 and A-5 rockets. So highly praised… so primitive. And the V-1 and V-2 would be feared when I thought them mere toys. Nevertheless, those men had gone. They had been moved to Peenemünde. They would not be here to observe what I was doing, would not know I

existed. In this I agreed with Himmler. Even the Führer would not know. Himmler had his own plans for the future and did not want them mentioned.

Himmler showed me around the hangars. He introduced me to the workers. I met the Italian, Belluzzo, who was old and gray-haired, and the younger Flugkapitän Rudolph Schriever, who struck me as being dangerously ambitious. The old Italian was a physicist. Rudolph Schriever was an engineer. Both men were engaged in aeronautical research, both were keen on my drawings. I didn't really want those men. They had been around too long. I was distressed by their knowledge of my work, and by their closeness to Himmler. They obviously wanted to impress him: bowed and scraped in his presence. I knew immediately that they would try to pick my brains and then usurp my authority.

I could not allow that. What I required was total secrecy. After my experience in Iowa, learning that no one could be trusted, I had already planned to strengthen my position by becoming invaluable. I would hide the most vital facts. I would doctor all the drawings. I would split the work up, spread it widely among the work force, and thus ensure that no single individual could duplicate my success. In this way I would protect myself. I would become indispensable. And so, as I shook hands, as I talked to Belluzzo and Schriever, I decided not to let them get too close to whatever was workable.

Yes, I was ruthless. I had to protect myself. I was aware of my dependence upon the Nazis and of how weak that made me. Sooner or later they might disown me – the war might drain their resources – and if that happened, I had to be ready to make good my escape. I would take my secrets with me. I would leave them only useless toys. But by then, if I made good use of my time, I would have what I wanted.

Such thoughts were not expressed. Himmler smiled and led me out. We returned to his car and climbed in and headed back to Berlin. There was paperwork to be completed. Requisition forms and orders: more manufacturers, more instruments, more pyrotechnicists, more welding experts and laborers. I did not think it was possible. The required numbers were outrageous. I wondered if even Himmler, with his frightening, godlike powers, could requisition workers in such numbers for a clandestine

project. Himmler smiled at my obvious doubts. He blinked repeatedly and stroked his nose. He said that I had no need to worry, that he had something to show me.

The fields of Germany were green. I heard aircraft overhead. We passed columns of troops and growling tanks, but the peace soon returned. This memory remains vivid. The sun shone from a blue sky. It was difficult to believe that war would come and devastate all of Europe. Then we passed barbed wire fences. Beyond the wire were smoking chimneys. We drove through guarded gates, beneath watchtowers and guns, kept driving toward the long wooden buildings, passed a series of gallows. The wind made the ropes dance. Ragged prisoners were digging ditches. We drove on and reached the center of the camp and saw the Reich's hidden nightmare.

Himmler made the driver stop. A nervous soldier saluted us. We stood together in the mud of the compound, surrounded by prisoners. Himmler smiled and rubbed his nose. I saw the guards with the bullwhips. The hundreds of men, women and children were filthy and silent. Nearly all had shaved heads. Their bones showed through their flesh. Their large eyes were filled with anguish and despair and a hopeless submission. I heard the crack of the whips. Dogs snarled and someone screamed. Himmler blinked and rubbed his nose, smiled with unstated pride, and then waved one hand languidly in the air to take in all the misery.

'Your workers,' he said.

Chapter Thirteen

'You don't go too close to UFOs. It's a dangerous thing to do. If you go too close to UFOs you get burned and you rarely recover. Just look at me, Stanford. I run this flea-pit in Albuquerque. I was a World War Two pilot, decorations up the ass; I fought in the Pacific and Europe and returned home a hero. What the hell am I doing here? You must have asked yourself that question. I ask the same question every night and I just wake up sweating.'

Gardner was leaning across the table, his right hand waving wildly, his left holding a glass of neat bourbon, the bottle in front of him.

‘Well, I tell you,’ he continued, ‘I’m not the only one like me. There are a lot of us hiding out, lying low, running scared, and we’re doing it because we haven’t a choice, because the doors have been closed to us. So you don’t talk about UFOs. If you do, strange things happen. You can never pin down just what it is, but things start going haywire.’

He raised his glass and drank more bourbon, slopping some down his shirt front, then he put his glass back on the table and looked around the bar. The place was crowded and noisy, a real home grown honkytonk, with a jukebox blaring out of one corner, the lights mercifully dim. Stanford picked up the bottle, refilled Gardner’s glass, glanced casually at the women along the bar to see if one was worth having.

‘You knew Ruppelt?’ Stanford asked.
‘Sure,’ Gardner said. ‘You wouldn’t be here if you didn’t know that. We worked for a time together, we respected one another, and even when he left, when those bastards pushed him out, he still came to see me now and then, very quiet, just for old time’s sake. Ruppelt was a believer. I’ve no doubts about that at all. He was a believer and he died a believer, no matter what his book said.’
‘You mean the revised edition,’ Stanford said.
‘Yeah, that’s right,’ Gardner said.
Stanford studied Gardner’s face, the hollow cheeks, the bloodshot eyes, taking note of the stubble on his chin and his badly stained teeth. Something had happened to Gardner – something not very nice – and now the former Air Force hero was a wreck, always drunk in his own bar.
‘I thought Ruppelt was a career man,’ Stanford said. ‘I’m surprised that he went against the grain by insisting – at least before that revised edition – that the UFOs were real.’
‘He believed in the Air Force,’ Gardner said. ‘And the *Air Force* believed that.’
‘I always thought they believed the opposite.’
‘That was bullshit, Stanford. Public Relations diarrhoea. The Air Force believed in the reality of the UFOs from as far back as 1947.’

‘Really?’
‘Yeah, really. I was with the Air Technical Intelligence Center at the time – then based at Wright Patterson AFB in Dayton, Ohio – and believe me, we were in a state of near panic. And why? Because contrary to their own publicity, the military was being plagued with their own sightings: first over Maxwell Air Force Base in Montgomery, Alabama, then, to our horror, over the White Sands Proving Ground, New Mexico – right smack in the middle of our A-bomb territory. Finally, what *really* got us going was a whole series of sightings in early July, 1947 – I think it was the eighth – over Muroc Air Base – now Edwards AFB – our top secret Air Force test center in the Mojave Desert.’
‘I know about those sightings,’ Stanford said. ‘They really were something.’
‘Fucking A,’ Gardner said.
He put his glass to his lips, had a drink, topped up the glass, cursed the noise of the blaring jukebox, then put his glass back on the table. Stanford topped his own glass up, glanced around the crowded bar, taking note of the Stetsons and boots and girls in tight dresses.
‘I’m told that those sightings led to Project Sign.’
‘They did,’ Gardner said. ‘No less a luminary than General Nathan Twining, commander of the Air Material Command, wrote to the commanding general of the Army-Air-Forces stating that the phenomenon was something real, that it wasn’t visionary or fictitious, and that the objects were disk-shaped, as large as conventional aircraft, and *controlled*. Shortly after that, about December ’47, we established Project Sign, gave it a 2A classification, and handed it over to WrightPatterson Air Force Base.’
‘That was just before the death of Captain Mantell.’
‘Yes,’ Gardner said. ‘A famous case.’
‘I’m told he died chasing a UFO, but the Air Force denies it.’
‘Right. Those fuckers tried to wipe it out. But that case, and a lot of other unknown sightings, really shook the hell out of us.’
‘How do you mean?’ Stanford said.
Gardner had another drink, licked his lips and glanced around him. He waved at a couple of friends and then looked back at Stanford.
‘Well,’ he said, ‘it prompted Project Sign to write an official, top secret Estimate of the Situation – and we didn’t piss around when we did it. That Estimate traced the whole history of UFO sightings, included the fireballs and ghost rockets and American sightings before 1947, and concluded, I kid

you not, that the UFOs were of extraterrestrial origin. We then sent the report through channels, all the way to the Chief of Staff, General Hoyt Vandenberg, but the good general, to our amazement, sent it back with instructions to bury it.'

Sipping his bourbon, Stanford saw a girl at the bar, blonde hair tumbling to her shoulders, her firm breasts pointing at him. He smiled at the girl, she smiled right back, and he placed his glass back at the table, then scratched his right ear.

'You run a good bar,' he said. 'Lots of action, I notice.'

'I do my best,' Gardner said.

'General Vandenberg sounds pretty odd to me. He must have caused you some problems.'

Gardner nodded his agreement. 'It was there and then,' he said, 'when that report was sent back, that we realized just how shitty our job was. In fact, word soon filtered back to us that Vandenberg had described us as being mad – and the repercussions of that judgement were pretty rough. Fear of further offending Vandenberg eventually led to a whole new policy: in future all Sign personnel were to assume that *all* UFO reports were misidentifications, hallucinations or hoaxes. Not only that, but we had to check with FBI officers, and with the criminal and subversive files of police departments, looking into the private lives of the witnesses to see if they were *reliable*. No need to say it: that was fair warning to all of us that it wasn't wise to open your mouth too wide… And shortly after that, the Project Sign Estimate of the Situation was incinerated.'

'Then Project Sign became Project Grudge.'

'Right. Can you imagine a more insulting name? A sure sign of General Vandenberg's displeasure.'

Glancing across to the bar, Stanford saw the girl with blonde hair, now talking to a heavily built brunette, both of them giggling. Turning her head, the blonde girl smiled invitingly at him, stroking her silky hair, then she turned away and whispered to the other girl and both giggled again.

'I've heard bad stories about Grudge,' Stanford said. 'A real shitty assignment.'

'Right. We were told to kill the whole affair. Now our job was to shift the investigation away from the actual UFOs and on to the poor bastards who reported them. Our task was to prove that the UFOs did *not* exist.'

'That must have been pretty difficult. I mean, according to the Grudge

Report, snow job though it was, a good twenty-three percent of your sightings were still classified as unknowns.'
'Big deal,' Gardner said. 'That was obviously still too much for General Vandenberg. The same day we released that report, the Air Force announced the termination of the project, all the Grudge records were put into storage, a few officers walked the plank, and the rest of our personnel were widely scattered.'
'But you remained.'
'Yeah.'
'You must have felt pretty bad.'
'I surely did,' Gardner said. 'I began to suspect that the Air Force top brass was only making a pretence at investigating UFOs when in fact they didn't want us to find out anything. I couldn't figure out their attitude. It didn't make sense to me. All I knew was that reporting unknowns could lead to really bad trouble.'
Stanford studied Gardner's face, saw the unfocused, bloodshot eyes, and was shocked by how far the man had fallen. It was best not to think about it. Men like Gardner were the victims. It was hard to think of Gardner as a highly decorated fighter pilot, hard to think of him working on Project Blue Book when that project was honorable. Gardner and Ruppelt had both paid the price. Now Gardner talked like a man without a future, still glancing fearfully behind him.
'Tell me about Ruppelt,' Stanford said. 'There's a really mystery there.'
'No mystery, Gardner said. 'Clear as glass. They just slipped the blade in.'
He topped up his own glass, emptied the bottle and put it down, picked it up again and waved to the barman and demanded another. Stanford sat back and waited. He didn't want to push too hard. This was supposed to be a casual conversation and it had to remain that way. Stanford glanced around the room. The air was dense with blue smoke. High-heeled boots stomped the floor, Stetsons clashed, the tight dresses were plentiful. Stanford saw the blonde girl. She smiled and raised her glass to him. Stanford thought she might soften up Gardner, so he nodded and grinned. The barman brought them another bottle. He slapped Gardner on the back. When he left, Gardner topped up both their glasses, then started talking again.
'Ruppelt was assigned to the Air Technical Intelligence Center in January 1951. Like me, he was working under Lieutenant Jerry Cummings. Now, up to that time Ruppelt hadn't paid too much attention to UFO reports, but

what he read in our files turned him on. As I remember, he was particularly impressed by two reports that involved movies taken at the White Sands Proving Ground. Now bear in mind that the Proving Ground was fully instrumented to track highaltitude, fast moving objects – namely, the guided missiles – and had camera stations equipped with cinetheodolite cameras located all over the area. So, in two different days in June 1950, two UFOs were actually shot by two different cameras, and the guys who examined the results, by putting a correction factor in the data gathered by the two cameras, were able to arrive at a rough estimation of speed, altitude and size. According to their reports, those UFOs were higher than forty thousand feet, traveling at over two thousand miles an hour, and were over three hundred feet in diameter.'

'Jesus,' Stanford said.

'Yeah, right. Now those reports really got Ruppelt going. He was hooked on the UFOs, started working like a beaver, and that's when we really got together, going through the old files.'

Gardner gazed around the room. He was clearly becoming restless. He owned the whole bar, it was his, and he wanted to use it. Stanford recognized the signs. Gardner seemed a little petulant. Stanford thought of Epstein waiting in Washington, and decided to push it.

'What led to Project Blue Book?' he asked.

'The Lubbock Lights,' Gardner said. 'Those and the Fort Monmouth sightings. They really stirred the shit up.'

'This must be boring you,' Stanford said.

'I don't mind.'

'Let's have a little company,' Stanford said. 'That blonde and brunette.'

Stanford swiveled around in his chair, raised his glass to the blonde girl, then waved his free hand in an inviting gesture. The blonde glanced at the brunette, looked back at Stanford, feigned surprise, then pointed her finger at herself and observed Stanford's nod of affirmation. Gardner looked on, surprised. He thought Stanford was pretty cool. The girls giggled and then walked across the room, holding on to each other. The jukebox was still shrieking. Couples danced without touching. The two girls pushed through the dancers, reached the table and stopped there, looked at Stanford and Gardner in turn and gave them broad, streetwise grins.

'Hi,' the blonde said.

'Peace on Earth,' Stanford said. 'We thought you might like to share a bottle

with two honorable men.'
'Oh, Jesus,' the brunette said.
'Don't pray,' Stanford said. 'We don't hold with religion on Friday nights. Just set yourselves down.'
They both giggled and sat down. Up close they looked different. The blonde wore skin-tight jeans and halter, her tanned belly exposed, her breasts thrusting forward in sexual challenge, her nose upturned, eyes hard. The brunette was far heavier, less pretty, even harder, her loose dress hiding unwanted flesh, her face masked in thick makeup. Gardner looked suspiciously at them. He was probably thinking they were hookers. The girls flicked their eyes at Stanford, looked away, giggled again and then sighed in unison.
'I'm Joanne,' the blonde said. 'This here's my friend, Carol. We both live on the other side of the tracks. We've never been here before.'
'I'm Stanford,' Stanford said. 'This gentleman is Mr Gardner. He owns this place. We're both bored with the sound of our own voices and we thought you'd distract us.'
The girls giggled again. 'That's a shame,' Carol said. 'You guys seemed to love one another. So *involved* with each other!'
'What were you talking about?' Joanne asked.
'UFOs,' Gardner muttered.
'*UFOs*?'
'Flying saucers,' Stanford said. 'Gardner's an expert.'
'Christ, they're creepy,' Carol said.
'Fantastic,' Joanne said. 'One of my favorite subjects. Are you *really* an expert?'
She stared straight at Gardner. Her blue eyes were like saucers. Gardner grinned and sat up in his chair, almost preening himself.
'I guess so,' he said.
'He's being modest,' Stanford said. 'This guy was chasing UFOs for the Air Force. He knows all about them.'
Joanne moved closer to Gardner, her breasts brushing against his arm, her blue eyes very large and excited, her knee touching his knee. Gardner couldn't resist it, acted more drunk than he was, putting his arm around the woman to hug her, grinning like an idiot.
'Tell her about the Lubbock Lights,' Stanford said. 'Give her all the details. If UFOs are one of her favorite subjects, she'll be fascinated.'

Gardner's dopey grinned widened. 'Okay, sweetheart,' he said. 'Let me give you a display of expertise that'll boggle your mind.'
Stanford poured them all drinks. Gardner drank and hugged Joanne. Carol, the brunette, shivered melodramatically and said, 'Shit, this is gonna be *creepy*.' Joanne giggled and snuggled into Gardner's embrace. Gardner grinned at each of them in turn, then he started talking.
'The Lubbock affair began on the evening of August 25, 1951, when an employee of the Atomic Energy Commission's supersecret Sandia Corporation – one with a top "Q" security clearance – looked up from his garden on the outskirts of Albuquerque to see a huge aircraft flying swiftly and *silently* over his home. He later described it as having the shape of a "flying wing", about one and a half times the size of a B36, with six to eight softly glowing bluish lights on the aft end of its wings. That same night, about twenty minutes after the first sighting, four professors from the Texas Technological College at Lubbock observed a formation of lights streaking across the sky: about fifteen to thirty separate lights, all a bluish-green color, moving from north to south in a semicircular formation… Then, early in the morning of the following day, only a few hours after the Lubbock sightings, two different radars at an Air Defence Command radar station located in Washington State showed an unknown target traveling at nine hundred miles an hour at thirteen hundred feet and heading in a northwesterly direction. But it didn't end there… On August 31, at the height of the flap, two ladies were driving near Matador, seventy miles northeast of Lubbock, when they saw a pear-shaped object about a hundred and fifty yards ahead of them, about a hundred and twenty feet in the air, drifting slowly to the east at less than the take-off speed of a Cub airplane. One of these witnesses was pretty familiar with aircraft – she was married to an Air Force officer and had lived near air bases for years – and she swore that the object was about the size of a B-29 fuselage, had a porthole on one side, made absolutely no noise as it moved *into* the wind, and suddenly picked up speed and climbed out of sight, seemingly making a tight, spiraling manoeuver. That same evening, an amateur photographer took five photos of a V formation of the same bluish-green lights as they flew over his backyard. And finally, a rancher's wife told her husband – who related the story to Captain Ruppelt – that she had seen a large object gliding swiftly and *silently* over their house. That sighting was made about ten minutes after the Sandia Corporation employee saw *his* object, it was

described as “an airplane without a body”, and the woman said that on the aft edge of the wing there were pairs of glowing bluish lights – the exact same description as the Sandia Corporation gave regarding his own sighting.’
‘Christ,’ Joanne said.
‘I don’t believe this,’ Carol said. ‘I mean, folks see things all the time. That’s not proof they exist.’
‘Well, listen to this,’ Gardner said. ‘We investigated all the Lubbock sightings thoroughly. First, we discovered that the Washington State radar lock-on was a solid target – not a weather target – and it was then easy to work out that an object flying between that radar station and Lubbock would have been on a northwesterly course at the time it was seen at the two places – and that it would have had a speed of approximately nine hundred miles an hour, as calculated by the radar. Next, we analyzed the five photos taken by the amateur photographer. The lights had crossed about one hundred and twenty degrees of open sky at a thirty-degree-per-second angular velocity – and that corresponded exactly to the angular velocity carefully measured by the four professors from the tech college at Lubbock. Analysis of the photos also showed that the lights were a great deal brighter than the surrounding stars and that their unusual intensity could have been caused by the exceptionally bright light source that had a color at the most distant red end of the spectrum, bordering on infrared.’
‘Jesus,’ Joanne said, ‘you sound like Einstein. What the hell does that *mean*?’
Gardner preened at her bewilderment, grinned at each of them in turn, then fixed his increasingly bleary gaze upon Stanford, now ignoring the ladies.
‘I think *you* know,’ he said. ‘Since the human eye isn’t sensitive to such a light, the light could seem dim to the eye – as many of the Lubbock lights did – but be exceptionally bright on film – as they were on our photos. And according to the Photo Reconnaissance Laboratory, at those days there was nothing flying that had those particular, almost magical, characteristics. However, what *really* knocked us out was the discovery that the lights on the photos were remarkably similar to the description given by the Atomic Energy Commission employee of the lights on the aft edge of the huge UFO that passed over his house.’
‘So,’ Stanford said, leaning forward, ‘*did* something fly over Albuquerque and travel two hundred and fifty miles to Lubbock at a speed of about nine

hundred miles an hour? And did the radar station in Washington State pick up that same object?'
'According to the witnesses,' Gardner said, 'and to our radar and visual tracking calculations, it did. Our Lubbock files were also studied by a group of rocket experts, nuclear physicists and intelligence experts, and they were all convinced that the Lubbock lights had to be of extraterrestrial origin.'
'Oh, God,' Joanne said, her eyes again like saucers, 'you hear that, they must be real. I mean, you hear that, they've *got* to be.'
'Shit,' Carol said. 'It's all shit. Let's talk about something else. What about sex?' She picked up her glass, had a drink, put the glass down, gave them all a look of mock disgust and then lit a cigaret, blowing smoke rings. Stanford smiled understandingly, reached out and stroked her cheek. 'Sex,' he said. 'I like the sound of that. I think we might even try it.' He sat back and smiled at her. His smile was returned. Joanne pouted in a theatrical manner and gave Gardner a hug. 'Just ignore them,' she said. 'I think it's really far out. I mean, you don't hear stuff like this every day. I feel kind of shivery.' Her breasts moved when she shivered. Gardner seemed a lot brighter. Stanford shrugged as if he didn't really care, but he topped up their glasses.
'I heard that the Pentagon was involved. Is that true, Mr Gardner?'
'Yeah, it's true,' Gardner said. 'Not many people know that. But the Pentagon, no matter what you're told to the contrary, was involved all right. The Forth Monmouth sightings started it. All the witnesses were top brass. Those sightings caused a fucking sensation and really got the ball rolling. I mean, within hours of those sightings we received a call from the Director of Intelligence of the Air Force, Major General Cabell, telling us to get someone from the ATIC to Jersey immediately and find out what the hell was going on. Shortly after that call, the T-33 pilot and an Air Force major who had tried to pursue the UFO were on an airplane to New York where they were grilled by two of our best men. By the following day, our two men, Lieutenant Cummings and Lieutenant Colonel Rosengarten, were sitting down in the Pentagon, having words with Major General Cabell. Every word of that meeting was duly recorded – but according to our sources the recording was considered so hot it was later destroyed. No matter… Now totally convinced of the legitimacy of the UFO problem, Major General Cabell ordered the ATIC to establish a few UFO project. And since Cummings was due for release from active duty, Captain Ruppelt

was put in charge of the operation. In April of 1952 Project Grudge was renamed Project Blue Book – and Ruppelt really took that project seriously.'
This was what Stanford wanted to hear. More importantly, it was what Dr Epstein wanted to hear, and Stanford had to deliver.
'Business,' Carol said. 'I'm fed up with all this shit. I think you two guys should make an offer. We've got a living to make.'
'Oh, for God's sake,' Joanne said, 'that can wait. I mean, we both need a break.'
'That's right,' Stanford said. 'Let's just keep drinking. Don't worry: Mr Gardner and I are here for the night – and we're not short of cash.'
Carol puckered her lips, glared at Joanne, then shrugged. Stanford quickly topped their glasses up, not forgetting Gardner.
'This is amazing,' he said. 'I can hardly believe my ears. I mean, I never thought they took it that seriously. The Pentagon! *Christ*!'
He was stroking Gardner's vanity and the response was immediate: Gardner removed his arm from Joanne's waist and leaned toward Stanford.
'Not only the Pentagon,' he said. 'The goddamned CIA, too.'
'What?'
'You heard me right,' Gardner said. 'By June of that year Project Blue Book was really going strong and had received more official reports than in any previous months of its history. In fact, the number of reports coming in at that time was fucking astonishing – and Air Force officers in the Pentagon became frantic. In July, the ATIC received over five hundred reports – more than three times the number received in June – and then, when one of the top dogs in the CIA – and most of his guests – saw a silent, vertically ascending UFO over his home in Alexandria, Virginia, General Samford, Director of Intelligence, called Ruppelt to a secret meeting in Washington DC. At that meeting you had General Samford, members of his staff, intelligence officers from the Navy and, according to Ruppelt, more than a few CIA officers. That was the first time the CIA officially stepped into the picture. It was also the start of all our troubles.'
'You mean that's when Ruppelt started getting screwed.'
'Exactly,' Gardner said. 'What finally burst the balloon was the unprecedented number of July sightings, peaking in the famous UFO invasion of Washington DC in 1952. After that, it was murder.'
'I'm filing my fingernails,' Carol said. 'I've nothing else to do. I'm sitting

on my ass turning numb, so I'm filing my fingernails.'
Everyone glanced at her. She wasn't filing her fingernails. Men and women were dancing close to the table and the jukebox was wailing. Joanne shook to the rhythm, grinned at Stanford and winked. Stanford smiled, but kept his gaze fixed on Gardner, hoping to keep him pinned down.
'That Washington sightings were incredible,' he said, 'but what went on in the background? I mean, what was the connection with Ruppelt? I think you said it affected him.'
'Yeah,' Gardner said, 'it did. Ruppelt wasn't in Washington during the night of the sightings, but he sure caught most of the flak. In fact, Ruppelt hadn't even been informed of the sightings; he only found out about them when he bought a newspaper at the Washington National Airport Terminal Building when he got off an airliner from Dayton, Ohio. He rushed immediately to the Pentagon, where he had an urgent meeting with Major Dewey Fournet and Colonel Bower, an intelligence officer from Bolling AFB. They told him that throughout the night, the restricted air corridor around the White House had been filled with interceptor jets trying to chase UFOs, that the UFOs had been radar tracked all around Washington, that an analysis of the sightings had completely ruled out temperature inversions, and that the radar operatives at Washington National Airport and Andrews AFB – plus at least two other veteran airline pilots – had all sworn that their sightings were caused by the radar waves bouncing off hard, *solid* objects.'
'So,' Stanford said, 'what happened to Ruppelt?'
'On behalf of the Air Force, Al Chops gave the press an official "No comment" on the sightings. In the meantime, Captain Ruppelt had been trying to set up a thorough investigation, but was shafted wherever he turned. He planned to go all over the area, to every sighting location, but he hardly got his foot out of the Pentagon. First, he called the transportation section for a car – and was refused. Next, he went down to the finance office to see if he could *rent* a car – and was refused. Next, he was reminded that he was supposed to be on his way back to Dayton, and that if he didn't leave he would be technically AWOL. Ruppelt gave up in disgust and returned to Wright-Patterson in Dayton.'
'Are you suggesting that the Air Force deliberately got rid of their most experienced investigator?'
'Well, what do *you* think it sounds like?'
'Okay,' Stanford said. 'So within a week to the hour of the first major flap,

a second UFO invasion took place over Washington DC.'
'Correct. And this time it was even more impressive… At about thirty after ten on the evening of July 26, the same radar operatives who had seen the UFOs the week before picked up several of the very same objects… and this time the UFOs were spread out in an immense arc around Washington – from Virginia to Andrews AFB. In short, they had Washington boxed in.'
Stanford glanced at Carol and saw her filing her fingernails, but when he turned to the bare-bellied, blonde Joanne, he received an excited grin.
'So,' he said, 'the White House took the invasion seriously.'
'Damned right,' Gardner said. 'Throughout that night there was chaos in Washington. The press was furious because all reporters and photographers had been ordered out of the radar rooms at the time the interceptors were chasing the UFOs. However, once the press were gone, arguments really blew up in all those radar towers and in the Pentagon itself. According to Dewey Fournet, the Pentagon liaison man, everyone in the radar rooms had been convinced that the targets had been caused by solid, metallic objects and couldn't possibly have been anything else. And whatever those things were, they could literally hover in the air, then abruptly accelerate to at least a couple of thousand miles an hour.'
'Lord have mercy,' Joanne said, looking even more excited. 'And to think I actually read about those saucers! Is it true President Nixon actually saw them?'
'It was 1952,' the brunette Carol reminded her. 'You've mixed up your presidents.'
'Yeah,' Gardner said. 'When I was there, word came down the grapevine that President Truman himself had almost gone apeshit when he saw UFOs skimming right around the White House. That story was quickly squashed by some of the President's aides, but shortly after, about ten that morning, the President's air aide, Brigadier General Landry, called Intelligence at Truman's insistence to find out what the hell was going on. Ruppelt, having returned to Washington, took that call, but he had to hedge his answers because he couldn't explain the sightings at all.'
Carol opened her shoulder bag, dropped her nail file into it, then stared at each of them in turn, her lips puckered distastefully.
'I'm finished,' she said. 'My fingernails are like new. I'm sitting here, trying to make a living, but I'm getting no action.'
'Oh, *Carol*!' Joanne snapped.

‘I’m just an ordinary working gal,’ Carol said. ‘I need to live, just like everyone else, but these two guys aren’t helping me.’
‘We have rooms,’ Gardner said.
‘I *know* that,’ Carol retorted.
‘Okay,’ Stanford said. ‘You have a deal. Just give us five more minutes.’
Carol sniffed and then nodded. ‘Okay,’ she said. ‘As long as that’s settled. I mean, we have other clients.’
Joanne smiled at Stanford. Gardner smiled at Joanne. Stanford winked at Joanne and then leaned forward, his eyes fixed on Gardner.
‘What do think it all meant?’ he asked.
Gardner sighed. ‘It was the Washington invasion, more than anything else, that made all of us at Blue Book a bit suspicious of the Air Force’s stance on UFOs. In fact, we spent over a year investigating those sightings, and what we came across really shook us. For a start, when the tower operatives at Andrews AFB were interrogated about the, quote, “large, fiery, orange-colored sphere”, unquote, that they had reported over their radio, they completely changed their story and said that what they had seen was a star – and that their mistake was due to their *excitement* at the time. Now, apart from the blatant idiocy of highly skilled radio operatives describing a normal star as a large, fiery, orange-colored sphere right over their control tower, Ruppelt also found out that according to astronomical charts there were *no* exceptionally bright stars where the UFO was reported to have been seen. Ruppelt then found out, from what he claimed was a reliable source, that the tower operatives had been *persuaded* a bit by their superiors. Likewise, the pilot of an F-94C, who had told us about vainly trying to intercept unidentified lights, later stated in his *official* report that all he had really seen was a ground light reflecting off a layer of haze – an equally ridiculous statement, since both the pilot and the radar had confirmed that the lights had repeatedly disappeared and reappeared in the sky before finally shooting away. Then, regarding the Air Force’s continuing stance that the lights had been caused by temperature inversions, we checked out the strength of the inversions through the Air Defense Command Weather Forecast Center – and at no time during the flap was there a temperature inversion remotely strong enough to show up on the radar. Finally, no weather target makes a one hundred and eighty degree turn and flies away every time an airplane reaches it. So the Washington DC sightings, according to Project Blue Book, are still unknowns.’

Stanford started to forget the girls. He felt a cold, clean excitement. He thought of Epstein in his office in Washington DC, waiting patiently to hear from him. Epstein had been right. The Air Force had covered up. Why they had covered up was a mystery that Stanford might yet solve.

'As I said,' Gardner continued, 'it was the official reaction to the Washington DC sightings that made a lot of us suspicious of the Air Force. Too many people were telling us one thing and then changing their stories for their *official* reports. Also, it was becoming increasingly obvious that the top brass of the Air Force were trying to blind us with some dodgy maneuvers. After the Washington sightings, Ruppelt became convinced that pilots reporting UFOs were being intimidated into either changing their reports or simply remaining silent, that a lot of information was being withheld from Project Blue Book, and that the CIA was stepping into the picture for unexplained reasons.'

'You were *really* worried about the CIA?'

'Yep. The guy who worried us most during this time was General Hoyt Vandenberg. Bear in mind that it was Vandenberg who'd buried the original Project Sign Estimate of the Situation, who'd reportedly called us all mad, and who'd directly or indirectly caused the fear of ridicule that has ever since hindered all UFO projects. It was also because of Vandenberg that the Sign Estimate was incinerated and that Project Sign was insultingly renamed Project Grudge. Now, while none of us could be sure of just how much Vandenberg was influencing either the Air Force or the CIA, the knowledge that he had been head of the Central Intelligence Group – later the CIA – from June 1946 to May 1947, that his uncle had been chairman of the Foreign Relations Committee – then the second most powerful committee in the Senate – that Vandenberg obviously still had great influence in those areas, and that pressure was always coming from those areas to suppress knowledge of UFO investigations… well, all of that did nothing to make us trust him any more. If therefore came as no surprise when we heard that the CIA and some high-ranking officers, including Generals Vandenberg and Samford, were, against the objections of the Battelle Memorial Institute, convening a panel of scientists to analyze all the Project Blue Book data. And nor did it surprise us to discover that this panel was to be headed by Dr H. P. Robertson, director of the Weapons System Evaluation Group in the Office of the Secretary of Defense – and a CIA classified employee.'

‘What do you know about the Robertson Panel?’ Stanford asked.
Gardner glanced at the two hookers, stared at Sanford, licked his lips, now excited and wanting to continue, but nervous of doing so. He glanced again at the hookers. Joanne smiled back. Carol had her chin in her hand, her lips puckered in boredom.
‘I’m becoming impatient,’ she said. ‘I think you two are giving us a snow job. I don’t think you intend taking us upstairs. A pair of fags, we’ve got sitting here.’
‘I can’t afford you,’ Gardner said.
‘It’s on me,’ Stanford said. ‘I’ve got a pocketful of bread and I’m horny, so let’s fix something up.’
‘Jesus, thanks,’ Gardner said. ‘I mean, that’s really decent of you. Tell you what… Send the ladies up to the room and then we’ll finish our talk.’
‘Oh, shit,’ Joanne said.
‘The rest of this talk is confidential,’ Gardner said. ‘I wanna finish this story with my buddy here, so just wait for us upstairs.’
‘How long?’ Carol asked bluntly.
‘About ten minutes,’ Gardner said.
‘Here,’ Stanford said, withdrawing some ten-dollar notes from his jacket pocket. ‘It’s a deposit. Just to give you a little confidence.’ Carol took the money and pushed it into her shoulder bag. She stood up and looked down at Joanne and said, ‘Okay, darlin’, let’s go.’ Joanne sighed and stood up.
‘What room?’ she asked. ‘We have to know the room number. We can’t fuck in the corridor.’ Gardner told her the room number. He said the key was in the door. Carol sniffed, as if clearing her nostrils, and then walked away. Joanne grinned at both men, followed Carol across the dance floor; they both passed the howling jukebox and disappeared through a doorway beyond it. Gardner refilled his glass, had a drink and glanced around him, then he leaned across the table to get closer to Stanford.
‘Okay,’ he said. ‘The only thing I really know about the Robertson Panel is that it was convened in secrecy in Washington DC in 1953, and that contrary to the evidence submitted by Project Blue Book it wrote a virtually negative report that led to the dissolving of our operation. First, the panel submitted its report to the CIA, the higher echelons of the Air Force and the Pentagon, but refused to give a copy to Ruppelt or any of the Blue Book staff. Next, Ruppelt and Captain Garland were summoned to CIA headquarters where it was explained to them that the Robertson Panel had

recommended *expanding* Blue Book's staff and terminating all secrecy in the project. Naturally, this encouraged Ruppelt, but his pleasure turned sour when he discovered that the CIA had been lying to him. In fact, it later transpired that the Robertson Panel had recommended a *tightening* of security, a mass *debunking* of the phenomenon, and a subtle ridiculing of UFO witnesses and the phenomenon in general.'

Gardner studied his own busy bar. The room was smokey and packed. The jukebox was wailing in the corner, surrounded by dancers.

'So,' he said. 'When it became obvious that the CIA had lied to us and that the Air Force was in fact trying to strangle Project Blue Book, a lot of us at the ATIC became pretty nervous. Ruppelt himself began to feel that he was facing growing opposition from the Pentagon to his plans for expanding Blue Book's activities. This feeling was confirmed when he asked for a transfer but agreed to stay on with Blue Book until a replacement could be found. He had asked for that transfer in December '52, but by the following February no replacement had materialized. Nor were there any replacements when Lieutenant Flues was transferred to the Alaskan Air Command, when Lieutenant Rothstein's tour of active duty ended, or when others on the staff either left or were transferred out. In short, Ruppelt departed from a drastically reduced Blue Book organization in February '53, and by the time he returned, in July of that same year, he found that the Air Force had reassigned most of his remaining staff, that they had sent no replacements, and that Blue Book now consisted of only himself and a mere two assistants. In other words, Project Blue Book had been fucked.'

'And you believe it was intentional?' Stanford said.

'Yeah,' Gardner said, 'it was deliberate. In fact, once Ruppelt left for Denver, it became clear to everyone involved that the Air Force had deliberately not replaced him because they wanted to strip Blue Book of its one remaining figure of authority. With no experienced officer in charge, Blue Book had little means of resisting the numerous transfers and subtle pressures that eventually strangled it. Of course, a few of us had tried to speak out against all that, but it was the worst fucking thing we could have done. More and more I saw guys getting harassed for no good reason, having their confidence shattered, their good records ruined, and then getting transferred out by way of punishment – or being asked to resign. That happened to me. Those fuckers just went out to get me. I started getting reprimanded for negligence, for dumb insolence and other shit, and

then they started moving me around from post to post, from one dismal hole to another. Eventually, I gave up. I couldn't take it anymore. I was drinking like a fish, my wife packed up and left, and in the end, like a lot of the others, I just had to resign… You don't go too close to UFOs. It's a dangerous thing to do. If you go too close to UFOs you get burned – and you rarely recover.'

Gardner picked his glass up and finished it off with one gulp, then wiped his lips with the back of his free hand and glanced blearily around him.

'Christ, I'm drunk,' he said. 'I think I need a good fuck. I have to blow this out of my system. Let's go find those two whores.'

He stood up and swayed, grabbed the table and steadied himself, then Stanford stood up and took him by the elbow and turned him around. They pushed their way through the noisy crowd, passed the dancers near the jukebox, emerged from the haze of blue smoke and found the semi-dark stairs.

'What happened to Ruppelt?' Stanford asked. 'You haven't told me. You didn't finish the story.'

Still swaying, Gardner started up the stairs. The drink had suddenly hit him hard. Stanford slid an arm around him and helped him up, wondering how his old friend had come to this.

'I don't know,' Gardner said. 'He just got fucked up like me. He came to see me shortly after he'd left the Air Force, and we drank beer and talked. His head was filled with questions. He couldn't let the subject go. He had left, but the subject still obsessed him and kept him awake at night. He wondered what had gone wrong with Blue Book. He wondered why they had run it down. He wondered why the Air Force had played a double game – and he kept asking questions.'

They reached the top of the stairs. The corridor was short and dimly lit. Gardner coughed, sounding choked up, then lurched forward, swaying dangerously from side to side. Stanford grabbed him and turned him around and pressed him to the wall.

'*What* questions?' Stanford asked.

Gardner coughed into his fist. He stared at Stanford with bloodshot eyes. When he spoke, his voice was harsh and self-mocking, revealing his bitterness.

'Why, when the Air Force was telling the whole world that the study of UFOs hadn't produced enough evidence to warrant investigation, did they

secretly order all reports to be investigated? Why, when all of us had actually read General Twining's statement that the phenomenon was something real, did they deny that such a statement had ever been submitted? Why, when they themselves had initiated Project Sign and received its official report concluding that the UFOs were of extraterrestrial origin, did they dissolve the project and then burn the report? Why, when Project Sign was changed to Project Grudge, did they go all out to ridicule the reported sightings and then disperse most of the staff on that project? Why, when the Air Force continued to claim that they had absolutely no interest in UFOs, did they insist that all reports be sent to the Pentagon? Why, when Lieutenant Cummings and Lieutenant Rosengarten discussed UFOs in the Pentagon with the Director of Intelligence of the Air Force, was the recording of that meeting destroyed? Finally, why did the CIA lie to Ruppelt, why was the Robertson Panel report kept from him, and why was Project Blue Book run down? Those questions haven't been answered.'
Stanford opened the bedroom door. The light beamed out into the corridor. The two hookers were sitting up on the bed, drinking more bourbon and giggling. The room was small and shabby. The double bed was unmade. Stanford pushed Gardner in, shut the door with a bang, then turned and went back along the corridor until he came to the stairs. He stood there a long time. The bar below seemed faraway. The semidarkness was alive with possibilities and strange, formless mysteries.
'Why?' Stanford asked.

Chapter Fourteen

'Why?' Epstein asked. 'We always come back to "Why?". There are too many contradictions and ambiguities. We have to know a lot more.'

Stanford sighed and nodded wearily. The Caribbean sun stung his eyes. He glanced back at St Thomas, at the bubbling white wake of the boat, feeling the deck trembling under his feet, hearing the engine's dull rumbling.

'I haven't finished yet,' he said. 'That Gardner was just the start. I have an old CIA friend in DC and he's promised to talk to me.'
'He's still in the CIA?'
'You've got to be kidding. No, he left about ten years ago… but he was

pretty high up there.'
'I want to know more about Ruppelt. I want to know what happened to him. I want to know what the Robertson Panel actually said behind closed doors. I want to know who was on that panel. I think that's fairly important. I want to know who they were and I want to know their precise recommendations. We were wrong about the Air Force. We've been fooled for twenty years. The Air Force and the CIA and the Pentagon have been involved, and that involvement has been kept under wraps. I want to know why.'
'This friend was in on it,' Stanford said. 'He assured me of that much. He said there were strange things going on and that they hadn't made sense to him. He's willing to talk. He'll pick up where the tapes left off. I'll go see him as soon as we get back and then give you a transcript.'
Stanford glanced around the ferry. There weren't many passengers on board. He saw a blonde-haired Dutch girl with the brown skin of a *vahine*, a couple of dusky workers arguing loudly in Creole French, a few American holidaymakers, gesticulating excitedly, snapping pictures, and a black woman of African descent selling mangoes and pineapples. They were all framed by the sea, which was calm, a dazzling blue, sweeping out to the cays and islets of the American Virgin Islands, their rolling hills blue-gray and parched green, a few clouds in the silvery sky.
'This is some place,' Stanford said.
'What did you think of St Thomas?'
'It looked like 42nd Street.'
'You should know,' Epstein said.
Stanford squinted against the sun. 'Is that the hotel?' he asked. He was looking at a sprawling, white-painted complex dominating an islet.
'That's it,' Epstein said.
Stanford nodded and turned around, leaned against the iron railing, let the trade winds blowing in from the northeast drying the sweat on his face. His gaze fell on the black woman, selling her fruit from a woven basket. She was wearing a white blouse and a skirt, a colorful apron over the skirt, and had a bright orange turban on her head, her black hair piled up under it. Stanford kept looking at her. She saw him staring and smiled back. She had laughing brown eyes, a sort of innocent sensuality, and he thought immediately of the girl on the porch of the ranch outside Galveston. He thought a lot about that girl and still couldn't understand it. He thought about that girl night and day, and was becoming obsessed with her.

‘Remember Galveston?’ He said.
‘Could I ever forget it?’ Epstein replied.
‘I’m thinking of going back there,’ Stanford said. ‘I want to talk to those people.’
‘That was a year ago.’
‘So, it was a year ago.’
‘That’s a pretty long time,’ Epstein said. ‘You won’t do any good.’
‘Why do you say that?’
‘They wouldn’t talk when we were there. The old man was possibly mad and the girl was dumb. I don’t think they’ll talk now.’
‘I don’t care,’ Stanford said. ‘I want to try anyway. I want to know what those people really experienced, and this time I’ll push harder.’
‘The Army might still be there.’
‘I don’t think so,’ Stanford said.
‘Okay,’ Epstein said, ‘please yourself. We have nothing but time.’
Epstein’s gray hair was being blown by the breeze, his jacket draped over his left arm, his grubby tie hanging loose. He had aged a lot in the past year, had thinned down and was coughing more, the lines on his face more predominant, his movements slow and exhausted. Stanford had noticed the change. It had begun with Irving’s death. Dr Epstein now looked his true age and was shrinking each day.
Stanford was also changing, was more tense, less ebullient, now driven by forces beyond his comprehension, seduced by riddles and mysteries. He thought constantly about the flatlands, about the lights in the sky, about the dust and the wind and the butchered cattle and the girl on the porch.
Stanford couldn’t understand it. It was much more than sex. He had thought about the girl for a year and now she seemed to be part of him. There was something unreal about it. He felt as if the girl was calling to him. He was losing track of time, losing touch with reality, and often felt that he was trapped in an eternal present, still blinded by dust clouds.
Life was an illusion. He believed that more and more. He had pursued the invisible for too long and now was paying the price. Nothing seemed real anymore, nothing here, nothing immediate; his sole reality was a night of wind and dust and strange lights and masked men. What did it all mean? Why was he now so driven? Stanford glanced around the ferry, saw the faces black and white, the blue sea and cays and islets that burned under a white sun. He felt hot and suffocated, almost dissolving where he stood, and

he turned toward the prow of the boat as it approached the small island.
‘That’s some hotel,’ he said.
‘It collects the vacation crowds.’
‘It looks like an old Moorish castle.’
‘A touch of Hollywood,’ Epstein said.
The ferry was nearing the island, heading straight for the rocks, then it turned and drifted toward a wooden dock and then bumped alongside it. One of the crew jumped off the boat, started tying the ropes to rusty bollards, while Stanford gazed up the climbing, parched land to the walls of the hotel. The walls were whitewashed and gleaming, broken up by Moorish arches, rising up in tiers above a swimming pool and lined with exotic plants and flowers. It was a single-storey building, sprawling across the upper slopes, dominating the sunbleached, rocky island with serene grandiosity. The ferry bumped against the dock. Crew members put the gangplank down. Stanford looked along the dock, saw a bus and some cars, a few people milling about in drifting dust, examining the disembarking passengers.
‘Is he there?’ Stanford asked.
‘Yes,’ Epstein said. ‘The man in the sports shirt and shorts.
‘They’re *all* dressed like that,’ Stanford said.
Epstein nodded and smiled, watched the passengers disembark, waited until the last ones had stepped off the ferry and then followed them down. He walked slowly and carefully, as if not sure of his footing, gazing down past the gangplank at the water which eddied and rippled. Stanford followed him down, glancing keenly around him, as the crystal-clear blue of the sea, the green islets, the silvery sky. The heat was incredible. The air shimmered before his eyes. He stepped onto the wooden dock, following Epstein’s stocky form, and a short man wearing a sports shirt and shorts stepped forward to greet them.
‘Long time no see,’ he said to Epstein. ‘You look pretty tired.’
The man was short and too fat, his shirt loosened around his belly, white hair blowing over bright green eyes and a tanned, good-humored face. He and Epstein shook hands, exchanged a few jocular pleasantries, then Epstein introduced Stanford, who also shook the man’s hand.
‘Robert Stanford,’ Epstein said. ‘I just call him Stanford. The name has a certain crass elegance that suits him quite well. Stanford, this is my good friend, Professor Tom Gerhardt.’

‘You’re still young,’ Gerhardt said to Stanford.
‘Is that surprising?’ Stanford asked.
‘I suppose not,’ Gerhardt said with a grin. ‘I just didn’t expect it.’ He waved his hand airily, indicating the whole island. ‘How do you like it?’ he asked.
‘A good place for a vacation,’ Stanford said.
‘That’s what *I* thought,’ Gerhardt said.
Epstein glanced up at the hotel, located at the top of the steep hill. ‘Do we have to walk up?’ he asked.
‘No,’ Gerhardt said, pointing at the dusty Volkswagen Beetle parked behind him. ‘I didn’t think you’d make it that far, so I brought my own transport.’
The other passengers were boarding the hotel bus that was parked just beyond the Volkswagen. The car and the bus were both parked on a tract of flat earth that overlooked the gently rippling azure sea. Beyond the bus, across that broad expanse of clear blue water, was St Thomas and the capital, Charlotte Amalie.
‘I come here every year,’ Professor Gerhardt said. ‘I come because there’s nothing to do here and that suits me fine… At least it did until *this* year.’
He opened the door of the Volkswagen and pulled the front seat forward. Stanford scrambled into the rear, resting his overnight bag on his knees, and sat there, bunched up in the cramped space, feeling uncomfortable. Gerhard sat in the driver’s seat and Epstein sat beside him, slamming the door as the car coughed into life and started up the steep hill. The road snaked around the islet, climbing toward the hotel on its summit, passing coco palms and divi-divi trees and tracts of parched, windblown grass. Stanford looked out the window. The sea was spread out far below him. He saw the cays and scattered islets, the sea blue and sun-reflecting, motor launches racing around coral reefs, helicopters above them. Then the Volkswagen reached the hotel and spluttered into silence, stopping between dazzling white walls and high, white-washed arches.
‘Home sweet home,’ Gerhardt said.
He opened his door and clambered out, pulled the seat up for Stanford, and the latter, pushing his bag out ahead of him, emerged gratefully onto the driveway. Epstein clambered out the other side, slung his own bag over his shoulder, stretched himself, nodding his head in appreciation, and then grinned at Stanford.
‘The one advantage about this job,’ he said, ‘is that a man gets to travel.’
‘It’s damned hot,’ Stanford said.

‘It’ll soon become cooler,’ Garhardt said. ‘The sun will go down in an hour or so; then you’ll feel a lot better.’
‘We’d better check in,’ Epstein said.
‘I booked two rooms the minute I received your cablegram confirming that you could come, so you just have to pick up your keys. Now do you want to go immediately for a rest or would you rather we talked first?’
‘I could do with a drink,’ Stanford said.
‘We’d better talk straight away,’ Epstein said. ‘We’ll be leaving first thing in the morning, so let’s go to the bar.’
‘Have you eaten?’
‘No.’
‘Then let’s eat,’ Gerhardt said. ‘I’ll tell you the whole story over a meal, and then you can sleep on it.’
They left their bags at the reception desk, collected their room keys, then were led by Gerhardt across a cobbled courtyard, emerging into the gardens. He then led them up some steps, across a cool, covered patio, and finally into an open-air restaurant overlooking the sea. The restaurant looked like an expansive terrace, its white walls strewn with flowers. Lanterns dangled from the ceiling, glowing red, green and yellow, though their light was rendered redundant by the sunlight pouring in over the verandah wall. Gerhardt sat them on the verandah, at a table against the low wall, and Stanford looked down to see the parched earth falling away to a crowded swimming pool. There was a bar by the pool. Girls in bikinis and men in swimming trunks were drinking fancy cocktails. Beyond them their distant, shadowed figures was the sea and the crimson sinking sun.
‘Apart from fish,’ Gerhardt said, ‘I couldn’t honestly recommend the menu. Most of the food in the Caribbean comes in cans. Only the fruit and the fish are fresh.’
‘I’ll have lobster,’ Epstein said.
‘Crayfish,’ Stanford said. ‘And I’ll start with a very tall rum and Coke to make myself feel at home.’
‘I’ll just have a cold beer,’ Epstein said.
Gerhardt ordered for them. Over the meal, he and Epstein talked about old times, when they had both been young, fresh-faced physicists working at a variety of government-sponsored research establishments in the White Sands Proving Ground, New Mexico, before going their separate ways, Gerhardt to the Cheyenne Mountain Complex in Colorado, Epstein to his

UFO work for the APII. Stanford studied Gerhardt carefully. He liked the man a lot. Gerhardt had a sense of humour, a natural openness and ebullience, but beneath his spontaneity was a tension that was finely suppressed. And although he talked a lot, he didn't mention why he had called them to the Caribbean until they had all finished eating. The sun was going down by then. The sea resembled flowing lava. The islets dotting the crimson water were casting shadows that undulated and deepened. Gerhardt sat back in his chair. A yellow lantern shone its light into his eyes. He sipped his beer and glanced uneasily around him and then focused on Epstein.

'All right,' he said. 'So why did I ask you to come and see me?'

'I'm dying to know,' Epstein replied.

'As you know, I'm still working for NORAD in the Cheyenne Mountain Complex.'

'Yes.'

'Well, for the past year things have been going haywire there: computers malfunctioning, data cards disappearing, the printouts from our worldwide network of radar stations coming in either erratically or not at all. Even worse: we have quite a few spy satellites whose sole purpose for being is to photograph the Semipalitinsk laboratory in Russia, where we believe they're creating some extraordinary pulse beam weapons. So, what happens? Our damned satellites start malfunctioning. A couple get knocked out of the sky – we don't even know where they went – and the rest take their turn in malfunctioning in inexplicable ways. We don't know what's happening. We just can't pin it down. We've checked the whole complex from top to bottom, but we can't find a fault.

'Okay, so I'm in trouble. I'm supposed to be in charge of the data input. Eyes are aimed suspiciously in my direction and my nerves start twitching. I should *know* what's causing the problems – it's my field; my speciality – but I'm sitting there in the Operations Center, just chewing my fingernails. I haven't a goddamned clue, I can't find a single reason, and now I'm being checked out by the FBI and my credibility rating is zero.'

'This all started a year ago?'

'That's right, Epstein: a year ago.'

'Have you taken on any new staff since then?'

'Not one. They're all old hands with top security clearances.'

'Okay, continue.'

‘Right. Now listen to this. For the past three months or so this has all been getting on top of me: my nerves playing up, too many sleepless nights, sweating and trying to work out my problems and then just sweating even more. Then I get a phone call. It’s from a guy named James Whitmore. He says that he works for ACASS, that they’ve heard I’m having a bad time, and that they want me to work for them in Europe and will pay me a lot. I tell him to put it in writing. He says he can’t do that. He says that I’m to meet him in a certain hotel for a drink and a talk. I tell him I’m not interested. He becomes very insistent. I get angry and tell him to shove off, but that just makes him chuckle. Things won’t get better, he says. Things will only get worse at NORAD. He says that he’ll get me sooner or later, then he chuckles again and hangs up.’

Gehrard sipped some more beer, then sighed and looked over the low, flower-strewn wall at the sun’s dying rays.

‘I started worrying about that call,’ he said. ‘It seemed an odd way of approaching a scientist. I also wondered how ACASS, a Europeanbased commercial company, could know about the problems we were having in our top-secret establishments. So, I called ACASS. I rang their personnel manager. He said that he hadn’t heard about me, that he hadn’t planned to offer me a job, and that they didn’t have a Whitmore on their staff and that I’d just had my leg pulled.’

Gerhard picked up his glass of beer, studied it distractedly, then placed it back on the table and started drumming his fingers.

‘I couldn’t forget that guy,’ he said. ‘I wondered who he might be. If he knew about my problems, he either worked right there with me or had a friend planted in NORAD, passing back information. I told this to the FBI. They ran a check, but came up with nothing. They thought it might be a practical joke – a silly and dangerous practical joke – and they told me to keep my eyes on my own staff and then report my suspicions. I just couldn’t accept that. None of my staff are that dumb. I thought recalled what the guy had said – that he would get me sooner or later – and I couldn’t shake that statement from my head and my nightmares increased.’

‘Do you mean nightmares literally?’

‘I mean a nightmare is a nightmare is a nightmare – and that’s what I was having.’ Gehardt sat forward in his chair, his face ghostly in the yellow light, the lanterns glowing brighter in the deepening darkness, the restaurant filling up. ‘What happened next was really strange,’ he said. ‘First, my

wife's at home on her own one day when she hears an unexpected knock on the door. She opens it to find these three guys on the porch, all dressed in dark suits, businesslike, all extremely polite. These guys then start taking turns at asking my wife various questions: Is she the wife of Professor Gerhardt? Is Professor Gerhardt at home? When would be the best time to come and see him? And so on and so forth – all very polite, but insistent. My wife is unnerved. She asks the men who they are. They say they're from the Federal Bureau of Investigation, but that's all they can tell her. Then my wife gets angry and demands to know what they're after. At that, they just nod their heads, back away to a waiting limousine, climb in and then drive off down the street… My wife tells me all about this and I start wondering what's going on. I have a friend in the FBI, he's a hundred percent loyal, so I call him and ask him to check it out and he tells me he will. He calls me back the next day. He says the CIA are worried about the foul-ups in NORAD, but neither they nor the FBI sent men around to my house. This turns out to be true. We have a visit from the FBI. They spend a couple of hours grilling my wife, trying to find out if she knows more than she's telling, if she actually knows who those men were. Naturally she insists that she told the truth and that she hasn't a clue who the men were, so finally, reluctantly, they leave her in peace. Though she was – and remains – badly rattled.'

Darkness had fallen. The stars were glittering like diamonds. The restaurant was nearly full, the clientele elegantly dressed, and the lanterns glowed red, green and yellow on blond hair and bronzed shoulders.

'That was the first thing,' Gerhardt said. 'It wasn't to be the last… Three days later I get another phone call. It's from Mr Whitmore again. He asks me if I'm willing to reconsider his previous offer. I don't mention my call to ACASS. I'm too confused to think about it. I ask him if he knows about the men who dropped in on my wife. The bastard just chuckles. I demand to know who he is. He replies that he'll get me pretty soon, then he chuckles again and hangs up… The next night it's even worse. I'm on my way home from work. The car abruptly cuts out, its headlights go out, and I'm stranded in the middle of the desert wondering what the hell's happened. Then I see three men. They're walking along the road toward me. It's so dark I can't make out what they look like, but they've definitely advancing in my direction. I look beyond them and see nothing. I'm trying to work out where they came from. They come closer and they're wearing coveralls, but

I can't see their faces. Then I'm really frightened. I suddenly panic. I try to start the car and nothing happens and I just can't believe it. I look at the men again. They're very close to the car. I look behind me and see another car coming out of the distance. Then I hear a strange noise. I turn back to the front. The three men have disappeared and then the other car passes and my own car starts up again… I didn't touch the ignition. I didn't do a damned thing. The car just started and I put my foot on the gas and drove home like crazy.'

Gerhardt sat back in his chair. The shadows fell across his face. Epstein and Stanford glanced at one another, neither saying a word. The darkness was now complete. The stars glittered in lonely splendour. The restaurant was noisier, a steel band played calypso, and the lanterns glowed red, green and yellow on the flushed, happy faces.

'I was frightened,' Gerhardt said. 'I still can't forget that night. Shortly after, the nightmares began – one nightmare each week. That's how they came. They were as regular as clockwork. Every Wednesday, the same night every week, I would have the same nightmare. The car broke down on a Wednesday. Every Wednesday I'd relive that. The dream would always end just as the three men were about to reach me and my wife would have to shake me awake to cut short my screaming.'

Gerhardt glanced uneasily around him, his face bathed in the yellow light, a white Moorish arch behind his head, the sea beyond that.

'That's why I came here alone,' he said. 'I just had to get away. I was hoping that if I came here I'd relax and the nightmares would stop.'

'But they didn't,' Epstein said.

'No,' Gerhardt said. 'Instead, I start having them every night… and then something else happened.'

'Three days ago.'

'Right.'

'That was Wednesday.'

'Right. It happened at midnight every Wednesday and it scared the shit out of me.'

Stanford glanced over the low wall, looking down on the swimming pool, to see the water reflecting the string of lanterns that were strung up around it. The bar down there was now closed. There was only one person left in the pool. It was a girl in a red bikini, swimming gracefully and down, her long blonde hair trailing out behind her like ribbons of gold. Stanford

turned back to Gerhardt. He was leaning across the table. His green eyes were slightly obscured by the yellow light that flowed out of the lantern.
‘I couldn’t sleep that night. I was just lying on top of the bed. It was hot and the room was pretty bright because of the moonlight. Then the moonlight disappeared. It just seemed to blink out. The room was plunged into darkness and I looked through the window and I couldn’t see a star in the sky. That sky was pitch-black. I couldn’t see a thing out there. I couldn’t see the walls of the room, and then it suddenly turned cold. Then the fear came. I remembered my nightmare. The fear increased and I tried to sit up, but I couldn’t move a muscle. That really terrified me. I was completely paralyzed. I tried to scream, but I couldn’t make a sound and I seemed to be freezing. Then suddenly there was light. It poured in from the balcony. The doors opened and two figures came in and advanced straight to the bed. I couldn’t see them very well. They were silhouetted in the dazzling light. They were wearing one-piece suits, were no taller than five feet, and their heads were tilted toward me, looking at me, neither saying a word. I just lay there, paralyzed. I’d never known such fear before. I just lay there and watched them as they walked up to the bed, as one started leaning over me, his hand reaching out to me. He pressed something against my neck. It was cold and then it burned. I tried to scream, but I couldn’t make a sound, and then the pain, the burning, went away. I stared up at the two men. I couldn’t think through my fear. Both men made a little bow, a kind of curtsy, and then they walked from the room. “Saturday,” I thought. I thought one of them said “Saturday”. I don’t believe they said anything at all, but that word filled my head. Then they were gone. There was a strange vibrating sound. The light from the balcony blinked out and the moonlight returned. I remember the moonlight. I remember wanting to sit up. I fell asleep and I didn’t have dreams and I awakened refreshed. Then I went to the mirror. I examined myself. There was an ugly red scar on my neck where that man had touched it with something. That scar has gone already. Maybe it never really there. But I don’t feel any fear anymore… I feel an odd, calm elation.’
Stanford studied Gerhardt’s eyes, thought of the girl on the porch of the ranch near Galveston, shivered and then turned his head away and looked down at the swimming pool. The blue water reflected the lanterns. The golden girl had disappeared. The pool was a rectangle of light in a vast, starlit darkness. Stanford turned his gaze on Epstein. The old man scratched

at his beard. Stanford returned his gaze to Gerhardt, saw the green eyes in yellow light, and he thought again of the girl on the porch and felt the mystery deepening.
'This is Saturday,' Stanford said.
'That's right, Dr Stanford. This is Saturday and I'm talking to you and I don't feel a thing.'
'Anything else?' Epstein asked.
'Yes, there's something else. I feel that something's going to happen tonight, and I believe it concerns you.'
Epstein scratched at his beard, glanced thoughtfully around him, saw the diners at the other tables, couples dancing on the stone-slab floor, the silk shirts and snap brims of the Trinidadian band members , the colored lanterns swaying in the breeze that trickled through the restaurant.
'Why call us?' he asked. 'There must be more than that.'
'There is,' Gerhardt said. 'There's something else… and it's right up your street.' He leaned farther across the table, his chin propped up in his hands, his green eyes diffused in the yellow light, the white arch behind him.
'There's an English film crew here,' he said. 'They're making a movie about Captain Cook. Now the morning after the incident I was talking to their stills photographer, a young guy who was looking pretty stunned. He knew I worked for the government, that I was some kind of scientist, so he thought I was the best man to talk to. Apparently, the night before – about the same time I was having my little experience in my room – he had been down on the beach trying to take some low-speed shots in the moonlight. He was taking some pictures of the movie's replica of Captain Cook's ship, the *Endeavour*, and he managed to shoot one roll in color. Now, the next morning, when he developed that film in his room, he was startled to see what appeared to be a very large, blurred, milky-white, disk-shaped object hovering in the night sky above the boat. What really stunned him about this was his conviction that at no time during the shooting of those pictures had he seen anything but stars in that sky. He was absolutely convinced of this. He was willing to swear to it. And yet that huge diskshaped object was in nine of his thirty-six pictures, a little higher up in each single picture, finally cut off by the top of the frame in the very last one.'
Stanford glanced over the wall, saw the dark sea and sky, the stars glittering above the gliding moon, a few clouds drifting languidly. He then looked at Gerhardt's eyes, recalled the girl on the porch, remembered the lights in the

sky and felt a chill passing through him.
‘Any estimation of size?’ Epstein asked.
‘Pretty rough,’ Gerhardt said. ‘Judging by the land behind it, and by the boat just below it, we both thought it was at least a hundred feet wide – but we couldn’t be sure of that.’
‘What was the duration between each of the pictures?’
‘I’ve no idea.’
‘Anything else in the photographs?’
‘No. There was just a sort of glowing around the disk. The disk itself was quite blurred.’
Stanford knew what was coming. He looked directly at Epstein. The restaurant behind Epstein was busy and romantically lit. The lanterns glowed with different colors, candles flickered on all the tables, and the musicians on the small stage were excited, sweating over their instruments. The whole scene was enchanting, was too good to be true, so Stanford turned his gaze back upon Epstein, knowing what he would say.
‘We’ll have to stay,’ Epstein said. ‘I think we should hang around here for a while. I seriously doubt that anything else will happen, but you just never know. I also want to talk to that photographer. I want copies of all his pictures. I want the photographer to take me down to the beach and show me just where he was standing when he took those photos. So I guess we’ll just have to stay on.’
Gerhardt slumped into his chair, spread his hands and shook his head, then leaned forward again and looked right at Epstein, his green eyes very bright.
‘That’s the whole point,’ he said, almost whispering. ‘The photographer’s vanished.’
The rain started just before midnight, splashing in thick drops on the verandah outside Stanford’s room and making him open his eyes. There was a distant clap of thunder. The verandah doors rattled. Stanford cursed and glanced around the silent room and saw the white walls in darkness.
The thunder rumbled again. The rain fell more heavily. The doors rattled and Stanford stared at them, feeling strangely uneasy. The doors were still closed. The shutters revealed no moonlight. The thunder rumbled and the doors shook and rattled while the rain poured down heavily. Stanford thought he heard the sea, a muffled sound far below, the waves rushing in and washing over the rocks and then poured back out again. It was an

unexpected sound; he hadn't anticipated such weather. He closed his eyes and tried to fall asleep and thought again of the girl.
Stanford groaned aloud. He opened his eyes to see the ceiling. There was a wooden fan spinning above his head, casting cool air down upon him. He heard the rain on the verandah, falling even harder now. The thunder rumbled and the double doors rattled as if being pushed open. Stanford felt strangely nervous, unreal, disorientated, trying to sleep and thinking only of the girl… and of Gerhardt's green eyes. 'Godammit,' he muttered.
He closed his eyes and saw the girl. Her luminous gaze drew him in. He saw the thumb between her lips, the breasts thrusting against her dress, the triangle of her thighs and shadowed crotch, her belly pressed to the windowsill. Stanford felt himself hardening. He saw Gerhardt's green eyes, filled with fear and an odd elation, and he cursed and sat up on the bed and shook his head in despair.
The room was very dark. No moonlight came through the shutters. Stanford wondered what was happening, though of Gerhardt's fearful calm, then thought of the girl on the porch and of her empty, revealing gaze. She had Gerhardt had something in common: an unnatural calm, a sheltered secret; they had both seemed like people not quite real, couched in awed expectation. What had they both experienced? What dreams did their eyes conceal? Stanford sat up very straight and stared around him, seeing white walls in darkness. Suddenly, he felt frightened. He hadn't felt that before. The thunder rumbled and the double doors rattled as if being pushed open. Stanford shook his head disgustedly, stroked his own face, rubbed his eyes, than reached out and switched on the light and sat back with a sigh.
Then he heard the footsteps. They were advancing toward the main door of the room. He stiffened as if he had been stung, and just looked straight ahead. The footsteps stopped outside the door. He felt his throat drying. He held his breath and kept looking at the door and tried to hold his fear down.
'Stanford?' Knuckles hammered on the door. 'Are you still awake?'
Stanford exhaled his breath, took it in again, sighed again, leaning his head back on the pillow and feeling very relieved.
'Yes, Epstein, I'm awake.'
'Can I come in?'
'Why not?'
The door opened and Epstein entered.
'I saw the light under the door,' he said. 'I couldn't sleep either.' He was

wearing an old dressing gown, frayed at the edges, obviously purchased about 1955 and now far too tight for him. ‘I brought a bottle,’ he said.
‘So I see,’ Stanford said.
‘I thought you might be able to do with a drink… keep the rain from your doors.’
Stanford grinned at that, swung his legs off the bed, rubbed his eyes and then looked at the rattling doors.
‘That’s some storm,’ he said.
‘It certainly is, my friend. I’m wondering if there’s any connection. Where are the glasses?’
‘Why a connection?’
‘We can’t drink without those glasses.’
‘You’ll find a couple in the bathroom. Now why a connection?’ Epstein went into the bathroom, returned with two glasses, unscrewed the bottle of Scotch and poured two stiff shots.
‘Here,’ he said, passing one to Stanford. ‘It’ll settle your nerves.’ Stanford took the glass from him. ‘What makes you think I’m nervous?’
‘Aren’t you?’
‘Yes.’
‘So am I. That’s why I’m here.’
They both sipped their Scotch. Epstein sat in a bamboo chair. Stanford remained on the edge of the bed, observing the rattling doors. ‘You think there’s a connection?’
‘There might be,’ Epstein said. ‘This storm just blew up out of nowhere – and it’s uncommonly violent.’
‘You’re thinking of Galveston.’
‘We’re *both* thinking of Galveston.’
Stanford had another sip of Scotch. ‘I feel weird,’ he said quietly. The thunder rumbled again. They heard the crackling of lightning. The rain poured down on the verandah, whipped across by a howling wind, the wind making the double doors rattle, trying to push them both open.
‘How’s Gerhardt?’ Stanford asked.
‘I think he’s sleeping,’ Epstein said. ‘I had a look before I came here. His room lights were turned off.’
‘There’s something odd there,’ Stanford said.
‘You think so? I hadn’t noticed.’
‘I’m thinking of his conversation. He said the experience terrified him. A

minute later, he said he felt nothing, and then he said he felt elated. Those are contradictory words. His expression was also contradictory. His eyes were very bright, very eager and excited, yet the rest of his face was tense with fear… It doesn't really add up.' 'Is that what you saw?'
'It's what I *think* I saw.'
'He seemed calm when he went into his bedroom.'
'He seemed *unnaturally* calm.'
Epstein sipped some Scotch, his gray gaze roaming restlessly. 'Maybe you're right,' he said eventually. 'I *did* think he was a bit odd. I couldn't quite put my finger on it, but, yes, he was *too* calm. Given the nature of his experience, he should be more concerned than he is. And that was a pretty strange story he told. He mentioned Saturday night. That's tonight, Stanford.' Epstein drank some more Scotch, splashing a little on his wrist. 'I would love to have seen those photos,' he said. 'I wonder where that photographer went.'
'It's interesting,' Stanford said. 'I was thinking about it later. The photographer said he didn't see a thing when he was taking the pictures. I got to thinking of Gardner. He mentioned a similar case. I think he was talking about the Lubbock lights and the photographs taken at that time.'
'That's right,' Epstein said. 'It was definitely the Lubbock photos. Gardner said that what the photographer picked up was an exceptionally bright light source that had a color at the most distant red end of the spectrum. That means it was infrared – or something similar to infrared. That in turn means that the object would seem dim to the human eye but be very bright and clear on a photo. It's an interesting possibility. That's what we could have here. That disk could have been solid, giving off infrared light, and thus would have become invisible to the photographer while coming out on his photos.'
'Take it further,' Stanford said. 'Go beyond the known spectrum. If those objects could produce such a light, if they could produce it at will, that would explain why they could materialize and disappear in the wink of an eye.'
'It's possible,' Epstein said. 'It's within the bounds of probability. The UFOs are usually described as being surrounded by *glowing* colors: blue, green, yellow, orange, red. Assuming that we're dealing with a metal composed of already known elements – possibly of unusual purity and radical mixtures, but known elements nevertheless – that we can also

assume that what we are *not* dealing with is a magical metal that can actually transmit light.'
'I'll buy that.'
'Thank you.' Epstein cocked his ear to the distant thunder, shivering when the double doors rattled. 'So,' he said. 'Electrical discharges of unusual strength will sometimes lead to a soft white glow, a corona, near high-voltage transmission lines. This leads one to assume that our UFO may have either some sort of negative potential that causes electrons to leak into the atmosphere surrounding it, an alternating potential that agitates gas atoms in the surrounding atmosphere to their ionization potential, or even an alternating current within its own shell, which draws energy from that same surrounding atmosphere.'
'A neat theory,' Stanford said. 'But that only accounts for a *white* glow.'
Epstein smiled. 'Very true. However, what we're now assuming is that the UFO's luminosity is not caused by its own unique composition, but by the natural air closely surrounding it. Let's now bear in mind the fact that if atoms are sufficiently agitated by the absorption of electromagnetic radiation, a few of their electrons will be elevated out of their normal orbits or possibly removed from the atom completely; then, as further electrons fall back into these empty spaces, a certain amount of energy will be released and radiated away as photons. That being said, I need only point out that within the visible region a stream of such photons having the same wavelength and frequency will be seen by the human eye as an unusual, glowing color, ranging all the way from violet to red.'
'Electromagnetic radiation?'
'It fits in with our trace cases. We've often found unusual traces of electromagnetic radiation upon examination of reported landing sites.'
'Right. And assuming that such craft were made of some exceptionally pure composition of white metals – say, aluminium, magnesium, titanium or strontium – and that this unusually pure metal was electromagnetically charged, that would account for the fact that our UFO often appears to be white or silvery up close, a dull or dark gray when viewed through atmospheric haze, or is just as often surrounded by a glowing halo of various colors.'
'Precisely. And, of course, as you've just said, should it be able to create a color source beyond the known spectrum – and turn that source on and off at will – it could be invisible to the human eye, show up on normal film,

and yet materialize in our visible spectrum whenever it wishes.'
Stanford whistled softly. 'That would explain a lot,' he said. 'The whole subject is a mystery,' Epstein said. 'And it's driving me crazy.'
The thunder roared outside and was followed by crackling lightning. The doors rattled, making Epstein glance up, then he stared down at the floor. His own words were meaningless to him; they were words to bridge the silence. He was frightened and he didn't know why, which only made him even more frightened. Stanford clearly felt the same. He appeared to be deep in thought. They were both very frightened at this moment, neither knowing the reason. Epstein thought of Professor Gerhardt, thought of what Stanford had said: Professor Gerhardt had changed in a subtle manner, and was hiding some secret knowledge. Epstein sighed and sipped his Scotch, heard the beating of the rain. He thought of the night at Galveston, of the strange girl on the porch, of her ambiguous smile and distant gaze, her eyes fixed on the sky. He wondered what the girl had experienced, wondered how it had affected her; wondered if Gerhardt had been affected the same way, and, if so, to what extent. Epstein looked again at Stanford. His younger friend was pale-faced. He had never seen Stanford so tense before, and he cursed the whole mystery.
'We should go to sleep,' he said.
'I can't sleep,' Stanford said.
'What on earth do you think is going to happen?'
'I don't know,' Stanford said.
Epstein stared at the shuttered doors. They were rattling dementedly. Thunder roared and lightning flashed through the shutters and the doors shook again. Epstein felt that he was dreaming. The storm seemed to be unnatural. He saw Stanford rising slowly to his feet and then putting his glass down. Epstein couldn't think straight. He saw Stanford turning around. The lights suddenly went out, plunging the room into darkness, then the locks on the shuttered doors snapped and the doors were blown open. The howling wind rushed in, , sweeping Epstein from his chair, filling the air with flying sheets and pillows and papers and bottles. Epstein rolled across the floor, heard the sound of exploding glass. A fierce light filled the room, very warm, almost blinding, and he gasped and rolled into Stanford and they both slammed into the nearest wall. Stanford cursed and grabbed a leg of the bed. A bottle smashed above his head. The wind howled and pressed Epstein to the wall with debris flying around him. The heat. The

white light. He covered his eyes with his hands. The heat receded and he opened his eyes to see a black, streaming darkness.
'*Gerhardt*!' Epstein bawled.
He crawled toward the main door. A spinning sheet coiled around him. He cursed and clawed wildly at the sheet while the wind hammered at him. Then it hissed and receded. He looked up, disbelieving. The wind still swept the rain across the porch, but the storm seemed more natural. Lightning flashed across the sky, briefly illuminating the room; he saw Stanford rolling away from the bed and clambering back to his feet. 'Jesus Christ!' Stanford said. He glanced dazedly around him. Epstein clambered to his feet and shook his head and then rushed to the main door.
'*It's Gerhardt*!' he bawled.
Epstein pulled the main door open and found the corridor in darkness. He and Stanford both raced along the corridor until they reached Gerhardt's room. The room door was open. There was no one inside. Epstein cursed and looked frantically at Stanford and then they both started running.
The whole hotel was in darkness, doors opening and closing, people shouting as they hurried back and forth, a few carrying torches. Stanford and Epstein rushed outside. The wind howled along the terraces. The coco palms were bent low and creaking, silhouetted in faint light.
'*The beach*!' Stanford bawled.
They ran together along the terrace, passed Reception, crossed the patio, the wind howling and sweeping the rain about them, almost bowling them sideways. Stanford reached out for Epstein. They held on to each other. They fought their way through the rain and beating wind until they came to the gardens. Stanford pointed a finger. ' *– down there*! *Somewhere there*!' He started forward, pulling Epstein with him, thunder rumbling above them. The storm was demoniac, lightning ripped through the sky. They leaned forward and headed into the wind, circling around the hotel. Torches shone and blinked out. The gleaming white walls receded. They found the track at the rear of the hotel and headed for the beach. Epstein kept his head down. The thunder made his ears ring. He glanced up as more lightning ripped through the sky, a giant skeleton hand. Stanford was shouting at him. Epstein couldn't hear what he said. The wind howled beneath the rumbling of the thunder as the rain poured down brutally.

' *– there he is*! *Over there*!'

Lightning flashed across the sky, illuminating the ground below. Epstein looked ahead and saw Professor Gerhardt, a shifting ghost in the distance. Gerhardt was wearing his pyjamas. He was not looking back. He was hurrying toward a grove of coco palms that led down to the beach, his pyjamas flapping wildly about him, both hands on his head. More lightning flashed across the sky. A fierce glare flared up and died. The winding track and the surrounding earth and trees materialized and then vanished.

‘ – *what the hell is he after*?’

Stanford shouted against the wind, the rain hissing and sweeping across him. The lightning lit up the night and the distant palm trees. Professor Gerhardt had vanished. Stanford cursed and raced ahead. The lightning passed and he saw a strange glow fanning out in the sky.

‘ – *over there*! *That’s the path*!’

Stanford pulled Epstein onward. They stumbled toward the palm trees. Thunder roared and lightning tore the sky in jagged fingers of yellow flame. Then the darkness returned. They saw that glow above the sea. Stanford cursed again and Epstein groaned. The wind whiplashed the rain. The thunder roared and the wind howled through the trees and the mud made a squelching sound. It all seemed like a nightmare. The land flared up and vanished. They were blinded by lightning and lost in darkness, and they stumbled through the beating wind and rain as if running in circles.

Then they reached the palm trees, which were quivering, pouring rain. The lightning flashes and they saw a stretch of sea, a black sheet streaked with silver. Then it was dark again. Thundered rumbled above their heads. Stanford pointed to the left and started forward and pulled Epstein with him. They passed between the creaking trees. The branches shivered and drenched them. They left the shelter of the trees and found the path that ran down to the beach. More lightning illuminated the beach before returning to darkness. They had not seen the beach. To their right, between them and the beach, was a high bank of earth.

‘ – *we’re going down*! *Watch your step*!’

The steep track was running mud. They both slipped and tripped on stones. The track curved to the right, broadened out and then narrowed, climbed a little and then plunged on down and started leveling out again. The thunder rumbled above them, the wind howled and then receded, the rain lashed them in a final bout of rage and then abruptly ceased.

Epstein glanced up, surprised, saw a dark cloud drifting by, saw the stars and then gazed down sloping earth and saw a white stretch of beach. Epstein couldn't believe it. There was no wind there at all. Stanford jerked his wrist and pulled him forward and they both hurried downhill.

'*There he is*!' Stanford hissed.

They both stopped on the instant, saw a broader expanse of beach, Professor Gerhardt hurrying across the sand, his pyjamas still flapping. The moonlight fell upon him, elongating his shadow; he was drenched and his hands were by his sides and he seemed very fragile. Then he stopped walking. He was near the coco palms. Another man came into view, uncommonly small and slim, wearing a one-piece suit of silvery material, a strange cap on his head.

Stanford and Epstein were both stunned. They stared in silence, staring down. The banked earth limited their vision to a triangular stretch of beach, the long lines of trees forming one side, the other formed by the moonlit sea. Professor Gerhardt was near the trees. The small man had stopped in front of him. Epstein blinked and felt a pressure in his head, an almost imperceptible vibrating. The small man stepped up to Gerhardt, his suit gleaming in the moonlit. He reached out with his left hand, touched Gerhardt on the neck, then they both walked to the right and disappeared behind the high, muddy bank.

'Jesus Christ,' Stanford said, 'did you see that? *Gerhardt didn't resist*!' They both started running again, slipping and sliding down the track, the mud squelching beneath their bare feet, the branches shivering and dripping rain. Epstein felt cold and frightened, his head tight and vibrating. He thought he heard a bass humming sound, but he couldn't be sure. They stumbled together down the track, passed through moonlight and shadow, gasping as the branches dripped rain, further soaking their clothes. Stanford

cursed and then fell, tumbling down the last stretch of the hill. He rolled over and then clambered to his feet and they both raced to the beach.
'Oh, my God!' Epstein whispered.
They both slithered to a halt. The beach lay before them. It was fringed with coco palms and those trees formed a wall that stretched in a semicircle toward the sea. Out there in the sea was an eighteenthcentury ship. Its huge sails were billowing in the breeze, illuminated in white haze. The great disk was above the ship, was twice as long as the ship. It just sat there in the sky, about two hundred feet up, a dark mass in a plasma-like glow, the stars winking around it.
Stanford and Epstein just stood there. They were stunned by this awesome vision. They saw the past and the future in the present and were dazed by this miracle. The white sails of the ship billowed. The great disk glowed and pulsated. The air hummed and vibrated and seemed alive with some mysterious force. Epstein rubbed his stinging eyes. Stanford shook his head in wonder. The great disk hovered over the ship and they were both bathed in a silvery-white haze.
'It's the *Endeavour*,' Stanford said.
'What?' Epstein said.
'It's a replica of Captain Cook's ship.'
'What the hell's that *above* it?'
Stanford didn't reply, but merely stood there, gazing up. The great disk was a dark mass in a glowing haze, its details obscured. The breeze ruffled Stanford's hair. He glanced briefly at Epstein. They stared at one another, both speechless, wondering what they could do. The beach vibrated beneath their feet. They both heard the bass humming sound. The sound was all around them and above them and had no fixed direction. They both stared at the *Endeavour*. Its huge white sails billowed outward. Raising their eyes, they saw the great disk above, its glow hazing the stars.
Then Epstein remembered Gerhardt. He turned around to survey the beach. The sand stretched out to the curved wall of a cove at the end of the beach.
'Gerhardt must have gone there,' he said. 'There's nowhere else they could have gone. That creature must have taken him over there. I think we better go look.'
He started hurrying along the beach, followed instantly by Stanford. The light walling on the beach wasn't moonlight: it came from the great, hovering disk. Epstein was gasping, but he kept moving, his heart pounding

uncomfortably. The silvery-white haze fell across the nearby trees and made them look artificial. Epstein heard the lapping water, a rhythmic, timeless sound. He kept walking, feeling hollow and unreal, his head vibrating and tightening. He wondered what that was. He knew it came from the enormous disk. Stanford hurried up to his side and then passed him and raced on ahead. They were nearing the wall of the cove. Epstein felt a great fear. He saw a curved line of trees, a wall of stones, and then a roar split his eardrums.

The ground shook beneath him, sand swirling, sky tilting, and then he felt the ground under his back and he rolled toward the trees. A fierce light swept across him. He covered his eyes with his hands. The sand was whipped up to rain down upon him as his ears started ringing. Epstein cursed and smacked his own forehead, blinked repeatedly and then looked up; he saw Stanford scrambling back to his feet, bathed in incandescent light. Epstein pushed himself back up, but fell weakly against a tree. The tree shivered and poured rain upon him as he forced himself onward. Stanford's eyes were too bright, looking stunned and confused. The air around him was red, blue and yellow, the colors flickering and merging. They both looked out to sea and saw the stately *Endeavour*, bathed in moonlight and a spectral rainbow haze, the light flickering crazily. The great disk was still above it. The surrounding haze had disappeared. What they now saw was an immense, silvery disk rimmed with windows and flashing lights. The windows were long and narrow, curving strips of bright light, broken up by what seemed like black dots moving to and fro, inside. The colored lights were below the windows, running round the circular base, flashing from left to right, right to left, at incredible speed. The lights formed a kaleidoscope, flickering on and off brilliantly, turning the dark sea into blood and yellow lava and rippling green, changing the ship's sails into billowing rainbows, obliterating the starry sky.

Stanford gasped and turned away, shook his head and stared at Epstein. His friend looked like a translucent ghost, materializing and vanishing. Then they ran between the palm trees, scrambled over the wall of earth, slithered down to the cove on the other side and saw the flat, empty sand.

'We're too late,' Stanford said.

Epstein sighed and closed his eyes, his head vibrating painfully. The humming sound was all around him and above him and it seemed to dissolve him. He opened his eyes again. The shadows rippled with various

colors. He moved forward and saw a large sunken circle, the sand curled at its edge. Looking up at the sky, he saw a globe of hazy light. It was flying obliquely toward the great disk, moving slowly and gracefully.
'Oh, God!' Epstein whispered. 'They've got him.'
Then the great disk disappeared. The night was plunged into starlight. The billowing sails of the *Endeavour* were gleaming white in the moonlight. Epstein didn't remove his gaze. His tight head was still vibrating. He kept looking and he saw an enormous black patch where the stars should have been. Then he saw two squares of light, about three hundred feet apart. They were windows floating there in the sky, illuminated brightly from within. Then one of them blinked out and the glowing orb flew toward its partner. The glowing orb became a stark black silhouette in that square frame of brilliant light. Then the light blinked out, became a black hole in the sky, and the great disk reappeared, filled up the black hole, and the colored lights flickered on and off and then turned into a white haze.
The bass humming grew louder. The beach vibrated with some violence. The great disk became a dark mass within a pulsating glow, rising vertically toward the drifting clouds with serene, stately grace. The ship below it was untouched. Its sails billowed in the breeze. The white glow illuminated the blue sea and erased the stars nearest to it. The great disk continued ascending. The humming sound became fainter. The ground vibrated and then settled down and the silence was total. The great disk continued rising and shrinking until it was no more than a glowing ball. This ball reached the clouds and abruptly blinked out and the stars reappeared.
Stanford and Epstein were speechless. They stayed close to the lapping water. They stood there a long time, looking up, breathing deeply, bathed in the warm, silky moonlight, the stars glittering over them. The sea washed upon the sand, splashing lazily around their feet. They lowered their eyes and looked across at the *Endeavour*. There was no one on the boat. Its rigging shivered in the breeze. Its wooden hull was rolling from side to side, the boards creaking in protest. Stanford and Epstein stared at it. The white sails were bathed in moonlight. They looked up to see the stars in the sky, and then they both walked away.

Chapter Fifteen

‘Okay, Stanford, I want you to understand one thing: I’m going to give you the information, I won’t ever do it again, and if you even breathe my name in your sleep, I’ll have your name in a doggie bag. It’s a very dangerous subject. I like to think it’s all behind me. So when we’re finished, when you walk out that door, make sure it’s the last time.’

O’Hara looked like a prosperous man, his tie straight, his cuff links gleaming, his face lined to match the graying of his hair, his blue eyes clear and hard. He was framed by a plate-glass window, his backdrop Manhattan, and his broad frame seemed oddly out of place in the neat, paneled office.

‘Okay,’ Stanford said, ‘that’s fine with me. First the Robertson

Panel.’
‘According to my notes, the panel met from 14 January, 1953, to 17 January, in Washington, DC, and the meeting at the time was top secret. The seriousness with which the subject was to be treated may be best illustrated not only by the credentials of the men involved – all specialists in the physical sciences, with particularly emphasis on atomic research and advanced weaponry – but also by the fact that the group’s written verdict was to be given to the National Security Council and then – if the decision was that the UFOs were of extraterrestrial origin – to the President himself.’
‘That sounds like a heavy number,’ Stanford said.
‘It was,’ O’Hara said. ‘And what later intrigued me about the panel was that – at least according to the concrete evidence that I was seeing and hearing – the extraterrestrial was in fact a grim reality and that the existence of the UFOs had been proven. Nevertheless, and pretty much to my amazement, the panel rejected the findings.’ ‘What findings?’
‘I’ll just give you a few. They’ll be enough to convince you.’ Like so many of the people that Stanford had been interviewing in the past few years, O’Hara, while puffing on a fat cigar, read from the file he had in front of him. ‘For the first two days Ruppelt reviewed the Blue Book findings for the scientists, and what he said was pretty damned impressive. First, he pointed out that Project Blue Book received reports of only ten percent of the UFO sightings made in the United States,

which meant that in five and a half years about forty-thousand sightings had been made. He then broke the sightings down into the percentage that was composed of balloons, aircraft, astronomical bodies, and other misinterpretations, such as birds, blowing paper, noctilucent clouds, temperature inversions, reflections, and so forth, pointing out that this still left four hundred and twenty-nine as definite unknowns. Of those unknowns, it was clear that the most often reported shape was elliptical, that the most often reported color was white or metallic, that the same number of UFOs was reported as being seen in daylight as at night, and that the direction of travel equally covered the sixteen cardinal points of the compass. Seventy percent of those unknowns had been seen visually from the air – in other words, by experienced pilots and navigators; twelve percent had been seen visually from the ground; ten percent had been picked up by airborne and ground radar, and eight percent were combination visual-radar sightings. Ruppelt then greatly disturbed us all by confirming that the UFOs were frequently reported from around places like our atomic energy installations, harbours and manufacturing areas. Finally, he asked us to take note of the fact that according to radar readings there were recorded flight speeds of up to fifty thousand miles an hour.'

'You were right,' Stanford said. 'It sounds impressive.' 'Indeed,' O'Hara said, puffing smoke. 'And even more impressive

was the fact that Ruppelt and Major Dewey Fournet had completed an analysis of the *motions* of the reported unknowns as a means of determining if they were intelligently controlled. Regarding this, Major Fournet, who had an exemplary reputation, told us of how – by eliminating every possibility of balloons, airplanes, astronomical bodies and so forth from the hundreds of reports studied, and by then analyzing the motions of the UFOs in the remaining unknown category – his study group had been forced to conclude that the UFOs were, in the words of the group report: "intelligently controlled by persons with brains equal to or far surpassing ours." The next step in the study, the major explained, had been to find out where those beings came from; and since it seemed unlikely that their machines could have been built in secret, the answer was that the beings were from outer space. Surprised, Dr Stanford? Well, so were we… And we were even more surprised when, the following morning, we were shown four strips of movie film

that had been assessed as falling into the definite unknown category.' 'You mean the cinetheodolite movies taken by scientists at the White Sands Proving Ground in 1950.'
'Bright boy. Those plus the Montana Movie taken on 15 August, 1950, by the manager of the Great Falls baseball team, and the Tremonton Movie, taken on 2 July, 1952, by Navy Chief Photographer, Warrant Officer Delbert C. Newhouse.'
'And?'
'The Montana Movie showed two large, bright flights flying across the blue sky in an echelon formation. The lights didn't show any details, but they certainly appeared to be large, circular objects. The Tremonton Movie showed about a dozen shiny, disklike objects fading in and out repeatedly, performing some pretty extraordinary aerial maneuvers, and darting in and out and circling one another in a cloudless blue sky. Any possibility that the objects might have been astronomical phenomena was dispelled when the film clearly showed them heading in the same tight cluster toward the western horizon, and, more specifically, when one of them left the main group and shot off to the east.'
'Anything more positive than that?'
'Yep. The Montana Movie had been subjected to thousands of hours of analysis in the Air Force lab at Wright Field, and their analysis proved conclusively that the objects weren't birds, balloons, airplanes, meteors or reflections – in short, they were genuine unknowns. As for the Tremonton Movie, it was studied for two solid months by the Navy lab in Anacostia, Maryland, and their conclusion was that the unidentifieds were not birds or airplanes, were probably traveling at several thousands of miles an hour, and were, judging by their extraordinary maneuvers, intelligently controlled vehicles.'
Stanford gave a low whistle and sat forward in his seat, thinking back on what had happened in St Thomas and of how it had affected him. It had left him in a state of wonder, overawed and disbelieving, but now, as he listened to O'Hara talking, he began to accept it. 'That was the evidence,' O'Hara said, 'and it seemed pretty damned conclusive, but the Robertson Panel still managed to reject it. The panel members duly spent two days going over the evidence, but the results of their ponderings were preordained. Guided by myself and

my fellow CIA members, the panel simply concluded in their report that the evidence was not substantial, that the continued emphasis on the reporting of the phenomenon was resulting in, quote, “a threat to the orderly functioning of the protective organs of the body politic,” and that the reports clogged military channels, could possibly precipitate mass hysteria, and might encourage defense personnel to misidentify or ignore actual enemy aircraft. In short: the real problem wasn’t the UFOs – it was the *UFO reports*.’

Staring past O’Hara, Stanford saw the skyscrapers of Manhattan. Raising his eyes, he surveyed the blue sky with its drifting white clouds. The sky revealed nothing. Sighing, Stanford lowered his gaze. His friend O’Hara, a private detective, once a CIA officer, was leaning forward with his elbows on his desk, exhaling smoke from his nostrils. ‘So,’ he said, ‘we made some recommendations. First, we recommended that the two major private UFO organizations – the Aerial Phenomena Research Organization and the Civilian Saucer Intelligence – be watched because of what we described as their “potentially great influence on mass thinking” in the event of widespread sightings. Regarding this, we also inserted the sentence: “The apparent irresponsibility and the possible use of such groups for subversive purposes should be kept in mind.” Next, we recommended that national security agencies take immediate steps to strip the UFO phenomenon of its importance and eliminate the aura of mystery it had acquired, the means being a public education program. Finally, we outlined a program of public education with two purposes: training and debunking. The former would help people identify known objects and thus reduce the mass of reports caused by misidentification; the latter would reduce public interest in UFOs and thereby decrease or eliminate UFO reports.’

‘The liberal conscience,’ Stanford said, ‘would call that brainwashing.’

‘The liberal conscience,’ O’Hara said, ‘would be right.’ He grinned coolly at Stanford, leaned back in his chair, gazed momentarily at the ceiling, then, still puffing on his cigar, leaned over his open file once more. ‘As a means of pursuing this educational – or, in the vernacular, brainwashing – program, the panel suggested that the government hire psychologists familiar with mass psychology, military

training film companies, Walt Disney Productions, and TV personalities such as Arthur Godfrey to subtly convey this new thinking to the masses. They also – contrary to what we were later to tell Ruppelt – decided *not* to declassify the sighting reports, and implied – again, contrary to what we were to tell poor Ruppelt – that the Air Force should further *tighten* security and continue to deny nonmilitary personnel access to UFO files. In other words: kill it.'

Thinking back on Gardner in Albuquerque, Stanford realized that Gardner, though a drunkard, had been telling the truth.

'Despite my own involvement in the Robertson Panel recommendations,' O'Hara continued, again studying the notes in his file, 'it was shortly after their release that I began wondering what the hell was going on. As you can see for yourself, the whole point of the Robertson Panel was to enable the Air Force to state for the next decade or so that an *impartial* scientific body had examined the UFO data and found no evidence of anything unusual in the skies. While this was an obvious distortion of the facts, it *did* mean that the Air Force could now avoid discussing the nature of the objects and instead concentrate on the public relations campaign to eliminate the UFO reports entirely. And given the nature of the panel's recommendations, there's little doubt that they were directly responsible for the policy of ridicule and denial that has inhibited an effective study of the phenomenon ever since; and that has, to put it mildly, some *unfortunate* effects on the lives of a lot of perfectly responsible civilians and Armed Forces personnel.' 'You mean, humiliation of UFO witnesses was fairly standard.' 'More or less,' O'Hara said. 'Anyway, given our brief about national security – we were still fighting the war in Korea, the Soviets had exploded their first hydrogen bomb, and the Cold War was still at its chilliest phase – I could understand the need for such a charade. However, what I *couldn't* figure out was why our superiors wanted us to lie to Ruppelt – wanted us to tell him that Project Blue Book was being expanded instead of run down, that UFO info was going to be freed of restrictions instead of being further restricted – and why they wanted him to believe that he could carry on with his plans when in fact we intended stopping him in his tracks.'

'Did you ever find out?'

'I'm not sure, but let me tell you what happened… As you've

already indicated, you know what happened to Project Blue Book: it was practically wiped out. Also, by that time, the recommendations of the Robertson Panel were in full swing – and the most credible UFO witnesses, namely aircrews and radar operatives, had been successfully frightened out of submitting their UFO reports. But worse was to come… In August 1953 – the same month Ruppelt left the Air Force – the Pentagon issued Air Force Regulation 200-2. AFR 200-2 was drafted purely as a public relations weapon in that it prohibited the release of *any* information about a sighting to the public or media, except when the sighting was *positively* identified as natural phenomena. In addition, while the previous regulation had stated that sightings should not be classified higher than restricted, the new regulation insured that *all* sightings would be classified as restricted. Then, even worse, in December 1953 the Joint Chiefs of Staff followed AFR 200-2 with Joint Army-Navy-Air Force Publication 146, and this made the releasing of any information to the public a crime under the Espionage Act, punishable by a one to ten year prison term or a fine of ten thousand dollars. And the most ominous aspect of JANAP 146 was that it applied to anyone who knew it existed – including commercial airline pilots. Needless to say, that regulation effectively put a stop to the flow of information to the public. To all intents and purposes – and contrary to public Air Force pronouncements – the UFO project had been plunged into secrecy.'

Stanford thought of Albuquerque, of what Gardner had told him, of himself at the top of the stairs, dazed by incomprehension. That feeling was with him now, a growing fear that had no shape, and he began to understand that the facts were rarely what they appeared to be. He stared at O'Hara, his old CIA friend, wondering how such men managed to flourish without guilt or shame.

'Wait a minute,' Stanford said. 'I'm getting a bit confused here. You say that the CIA virtually directed the Robertson Panel, but that their main concern was national security – not a belief in the UFOs.' 'No,' O'Hara said, now returning Stanford's gaze. 'I'm saying that our superiors hoodwinked us.'

'I don't understand.'

'Listen,' O'Hara said. 'According to our superiors, the reason they wanted the interest in UFOs killed off was that the UFO *reports* were

deemed a threat to national security: first, because a deliberately confused American public might think attacking enemy aircraft were merely UFOs; second, because a foreign power could exploit the UFO craze to make the public doubt official Air Force statements about UFOs and thereby undermine public confidence in the military; and, third, because in terms of psychological warfare, particularly in 1952, the communications lines of the whole country could be saturated by a few hundred phone calls, and such calls – which *always* came after a rush of UFO sightings – were putting the defense network in jeopardy. Those were the reasons they gave us for the need for suppression.' 'But you thought they were bullshit,' Stanford said.

'Right,' O'Hara said. 'If national security was the issue, then the suppression had a certain amount of logic. However, if national security was the *only* concern, why were we humiliating so many UFO witnesses and harassing our own ground and air crews into keeping their mouths shut? The only logical explanation was that the higher echelons of the Air Force were more concerned about the phenomenon than they were willing to admit, that they possibly *knew* more about it than they were willing to admit, and that for reasons of their own they were actively encouraging their most competent personnel from investigating the subject.'

'Ruppelt seems to be the perfect example of all this.'

'Right,' O'Hara said. 'It seemed to me that the more proven unknowns Ruppelt came up with – and most of his unknowns *were* unknowns – the more nervous the Air Force became. I first realized this when the CIA told us to lie to him about the recommendations of the Robertson Panel. I was even more convinced when they neglected to replace him when he went to Denver, and when they stripped Blue Book of its staff in his absence.'

'Still,' Stanford said, 'that doesn't necessarily mean too much. As you said, if they were genuinely worried about the sheer number of UFO reports clogging their communications network, they would have wanted those reports reduced to the minimum.'

'Let me give you a better example,' O'Hara said. 'Shortly after scaring the hell out of the Air Force with the evidence presented to the Robertson Panel, Ruppelt came up with a couple of cases that virtually confirmed that the UFOs were intelligently controlled.' He returned his

gaze to the notes in his file. ‘The first was a sighting that occurred over Haneda AFB, now Tokyo International Airport, in Japan. This UFO was initially observed by two control tower operatives who saw a large, brilliant light in the northeast over Tokyo Bay. The light, which was moving, was observed through seven by fifty binoculars; it had a constant brilliance, was circular in shape, and appeared to be the upper half of a large, round, dark shape that was about four times the diameter of the light itself. Then, when it moved, the tower operatives saw a second, dimmer light on the lower edge of the dark, shadowy portion. This particular UFO was simultaneously tracked by radar and observed by intelligence officers as it flew back and forth across the central part of Tokyo Bay, sometimes almost hovering, then abruptly accelerating to three hundred miles an hour. It was pursued by, and deliberately eluded, an F-94 airplane.’

‘*Deliberately*?’

‘So it seemed,’ O’Hara said. ‘That sighting was thoroughly investigated by the FEAF intelligence officers in the area, then later investigated just as thoroughly by Ruppelt. Both agreed that it was definitely not a weather target, that it definitely wasn’t a star, that both visual and radar lock-ons had proved that it was solid *and* moving. They also proved that each turn the UFO made was constant, and that the straight “legs” between the turns were about the same length. Indeed, Ruppelt later wrote that the sketch of the UFO’s flight path reminded him very much of the crisscross patterns he used to fly during World War Two – and that the only time the UFO had seriously deviated from this pattern was when the F-94 tried to pursue it.’

‘And the second sighting?’

‘The second sighting was one that occurred on the night of 29 July, 1952, when an F-94 attempted to intercept a UFO over eastern Michigan. This sighting was even more interesting in that there was a definite reason for every move the UFO made. First, it made a one hundred and eighty-degree turn because the F-94 was closing in on it. Next, it alternately increased and decreased its speed – but only increase its speed when the airplane was closing in on it, and always slowed down when it was just out of range of the airplane’s radar. Then, adding weight to his argument that such moves could not have been random, Ruppelt submitted a third report – the one he called the best unknown ever – of an F-84 pilot

who chased a visually and radar located object right across Rapid City. According to the pilot *and* the radar operatives, that target accelerated and decelerated so that there was always *precisely* three miles between it and the F-84 – and it kept this up until the F-84 ran out of fuel. Later, both the pilot and the tower controller told Ruppelt that the UFO seemed to have some kind of automatic
warning radar linked to its power supply.'
'Okay,' Stanford said. 'Let's assume the UFOs were intelligently controlled… But what has this to do with the CIA?'
'Think,' O'Hara said, studying his dwindling cigar, forming his lips into an O and blowing a thin steam of smoke. 'If, as the CIA claimed, national security was their only concern, such sightings should have scared the hell out of them and made them want to know more. That, however, was not remotely the case. Instead of encouraging Ruppelt or utilizing his information, they went all out to stop him in his tracks – and they put him under surveillance.'
'So what you're saying is that they claimed to be concerned with national defense, yet they didn't want people watching the skies – a contradiction in terms.'
'That's right,' O'Hara said.
Stanford sighed and rubbed his eyes, feeling weary a slightly unnerved, convinced that he was getting out of his depth and approaching a danger zone. The contradictions were now obvious: national security did not explain them. It was clear that the Pentagon, the CIA and the Air Force were more concerned with the UFOs than they admitted and were still trying to hide that fact. He sighed again and studied O'Hara. His old friend's blue eyes were clear. Stanford shook his head wearily from side to side and wondered if he was dreaming. 'Keep going,' he said.
'Okay,' O'Hara said. 'I'll stick to Ruppelt for the moment. Because what Ruppelt did, and how the Air Force reacted, are representative of the whole shady story and might tell you a lot.' He stubbed his cigar out, put his hands behind his head, then leaned far back in his chair, now ignoring his notes. 'I had in fact been watching Ruppelt from about August the previous year, 1952 – and the order to report his movements simply intrigued me. Bear in mind that at that particular time there was a sudden rash of UFO sightings. Now, those

sightings were mainly the build up to the beginning of September, when every morning for about two weeks there were half a dozen or so new reports from the southeastern United States, notably Georgia and Alabama, a lot of them from the vicinity of the new, top secret Atomic Energy Commission complex at Savannah River, many more over Brookley Air Force Base near Mobile, Alabama. That same month the NATO naval forces were holding maneuvers off the coast of Europe, namely, Operation Mainbrace. On 20 September an American newspaper reporter and a group of pilots and flight deck crew on board an aircraft carrier in the North Sea observed a perfectly clear, silvery sphere moving across the sky just behind the fleet of ships. The object was large and appeared to be moving rapidly, and the reporter shot several pictures of it. The pictures were developed straight away and immediately studied by the intelligence officers aboard the carrier. The pictures were excellent, and the object looked like a large balloon – but no balloons were in the area and an analysis of all the photos proved conclusively that the object had been moving very fast. Then, the following day, six English Air Force pilots flying a formation of jet fighters over the North Sea saw a shiny, spherical object coming from the direction of the NATO fleet. They took after it and lost it, but when they neared their base one of the pilots noticed that the UFO was following them. He turned back toward it, but the UFO then turned away and outdistanced the RAF airplane in a matter of minutes. Finally, on the third day, a UFO was observed near the fleet, this time over the Topcliffe Aerodrome in England. A pilot in a British jet was sent in pursuit and managed to get close enough to describe the object as, quote, “round, silvery and white” and to note that it , quote, “seemed to rotate around its vertical axis and sort of wobble.” Then, when he tried to get closer, the UFO shot off…’

O’Hara sat forward again, removed his hands from behind his head, propped his elbows firmly on the desk and cupped his chin in his hands.

‘Naturally, those sightings disturbed NATO,’ he said. ‘In fact, according to an RAF intelligence officer in the Pentagon, it was the Mainbrace sightings that finally forced the RAF to recognize the UFO phenomenon – a fact they have denied to this day. However, Ruppelt investigated the case and assessed all those sightings as unknowns.

Unfortunately, this encouraged him to believe that he could now pin down the UFOs for good… and it was this very enthusiasm that led to the destruction of the most important system ever devised for UFO research.'

'Don't look so pleased,' Stanford said. 'Just tell me what happened.'

'Okay. For a long time Ruppelt and Brigadier General Garland, then chief at the ATIC, had been looking for a way of getting concrete information about the UFOs. What they finally came up with was a plan for visual spotting stations to be established all over northern New Mexico – an area that had consistently produced more UFO reports than any other area in America. The visual spotting stations would be equipped with specially designed sighting devices, all of which would be linked with an instantaneous interphone system: any two stations could then track the same object and, from their separate readings, compute the UFO's altitude and speed. Also at each visual spotting station would be instruments to measure the passage of any body that was giving off heat, any disturbance in the Earth's magnetic field, and any increase in nuclear radiation at the time of the sighting.' 'I never heard of it,' Stanford said, 'but it sounds pretty impressive.'

'It was,' O'Hara said. 'In fact, it was the first time that a proper, scientific system had been designed and submitted to the Air Force. It was virtually foolproof and if it had been adopted, we could have tracked, photographed and measured UFOs with unprecedented precision.'

'And you're going to tell me the Air Force killed it off.' 'Right.' 'Why?'

O'Hara shrugged. 'I'm not sure. All I know is that in December of that year – when Ruppelt's plans went to Washington, DC, for approval – the US Navy was going to shoot the first H-bomb during Project Ivy, and some folks in the Pentagon, remembering the unidentifieds over Operation Mainbrace, directed Ruppelt to fly out to the test area and organize a UFO reporting team.' O'Hara grinned laconically, spread his hands out in the air, then gently kicked his chair back, his legs lazily outstretched. 'As it is with the CIA, so it is with the Pentagon: there are wheels within wheels and somewhere there's a wheel you can't reach.

What I mean by this is that the order for Ruppelt to fly to Project Ivy came down in November, but by December his plans for the visual radar sighting network were received in Washington… and shortly after that I received a phone call from the Pentagon, suggesting that I axe Ruppelt's trip – which, naturally, I did.'

'So what you're suggesting is that certain people in the Pentagon are genuinely concerned with the UFOs, but that others, for some unknown reason, don't want the UFOs to be investigated.'

'What a bright boy you are.'

Stanford stared past O'Hara's head and saw the tops of the skyscrapers, the sun a silvery ball in the clear sky, the white clouds drifting languidly.

'So,' he said eventually, '*were* UFOs seen over Project Ivy during the shooting of the H-bomb?'

'I don't know,' O'Hara said, 'and neither did Ruppelt. Shortly after Project Ivy came the Robertson Panel and its consequences, and a few months later, in August '53, Ruppelt, doubtless feeling bitter, left the Air Force for good. By the end of that year, Project Blue Book had a mere three staff members left, its investigating authority had been handed over to the 4602d – the inexperienced Air Intelligence Service Squadron – and most of its projects had been strangled systematically through a reduction in funds. Ruppelt, Fournet and Chops were no longer involved, and General Garland, once a strong Ruppelt supporter, never again raised his voice in defense of any UFO investigation.' Stanford sat there saying nothing, not knowing what to say. He thought of Ruppelt and Gardner, of the deceptions and suppression, then he thought of Irving Jacobs in the desert and wondered what it all meant. The Air Force was covering up. The Pentagon was involved. The whole of Washington, DC, was concerned with the UFOs, but didn't want them investigated. Stanford didn't understand it. Nothing seemed to add up. The mystery deepened and swirled there before him like a black hole in space.

'It just doesn't make sense,' he finally said. 'What was the purpose of all that?'

'I kept asking myself that question,' O'Hara said. 'The only thing I came up with was the thought that maybe there was something in the UFO phenomenon – and, more intriguing, that maybe the Air Force

actually knew what the UFOs were and therefore wanted to keep the lid tight on the matter.'
'That could make sense,' Stanford said. 'Why else would they set out to ridicule their own pilots and ground crews? Why else would they encourage officers like Ruppelt to investigate the matter and then, when they came up with firm evidence, harass them out of the scene?' 'Right,' O'Hara said. 'And bear in mind how the defense forces operate. The Navy, the Army and the Air Force all run research projects independently of one another – and they usually keep their secrets to themselves. Likewise, in the Pentagon, there are departments so secret that even *the President* doesn't know what they're up to. The same could be said for the FBI and the CIA: behind the names there are numbers and those numbers can't be checked; those numbers represent the nameless men who create their own laws.'
'So,' Stanford said, 'there are always rumors.'
'Oh, yes,' O'Hara. 'For instance, just before I left the CIA, there were rumors going around that there'd been actual UFO landings on Air Force bases, one at Cannon AFB, New Mexico, on 18 May, 1954, another at Deerwood Nike AFB on 9 September, 1957, and a third at Blaine AFB on 12 June, 1965. Now the automatic response to such stories is to assume that they couldn't be true – that such events couldn't possibly be kept secret, not only from the public, but from the vast majority of FBI, CIA and Pentagon staff.'
'Not true,' Stanford said. 'Some of the most startling scientific discoveries have been kept under wraps with incredible efficiency for as long as fifty years. Antibiotics were discovered as far back as 1910, but weren't truly applied until 1940. Likewise, nuclear energy was discovered in 1919, but not generally announced until 1965. In short, no matter how big the secret, we can make sure it stays that way.' 'True,' O'Hara said. 'So… Could the fact that UFOs have landed on at least three different Air Force bases be kept a secret for almost a decade? I believe it could. I believe so because the Air Force, the Navy, the Army, the CIA or the higher echelons of the Pentagon could, if not *totally* suppressing such a fact, reduce that fact to a mishmash of vague speculation and rumor… And a very good example of this is the renowned Flying Flapjack.'
'That,' Stanford said, 'sounds familiar.'

‘It should be,’ O’Hara said. ‘The most interesting thing about the Flying Flapjack is that no one in the CIA had ever mentioned it until 1950, yet it had been designed back in 1942. The Flapjack, originally known as the Navy Flounder, was a circular aircraft being built by the US Navy during the Second World War. At that time, what the Navy desperately needed was an airplane that would not require long airfields, could rise almost vertically from an aircraft carrier, and could be used in any cleared area just behind frontline troops. What they came up with was a combination of helicopter and jet plane, a saucer-shaped machine powered by two piston engines and driven by twin propellers. The prototype, designed by Charles H. Zimmerman of the National Advisory Committee for Aeronautics and constructed by ChanceVoight, reportedly had a maximum speed of four hundred to five hundred miles miles an hour, could rise almost vertically, and could practically hover at thirty-five miles an hour. Apparently, because the aircraft was wingless, the lessened stability presented problems, but a later model – the one since reported to be…’ O’Hara checked his notes… ‘The XF-5-U-1. That model solved the problem and was rumored to be circular in shape, over a hundred feet in diameter, and with jet nozzles – which resembled the glowing windows observed on so many UFOs – arranged right around its outer rim. Further, it was built in three layers, with the central layer slightly larger than the other two. And since the saucer’s velocity and maneuvering capabilities were controlled by the power and tilt of the separate jet nozzles, there were no ailerons, rudders or other protruding surfaces.’

‘A genuine flying saucer,’ Stanford said.

‘Right,’ O’Hara said. ‘Now, as I’ve already stated, no one in the CIA – at least no one I dealt with – knew a damned thing about that machine until early 1950 when the Air Force, in a bid to legitimize their December 1949 termination of Project Grudge, released photos and vague technical info about the Navy Flounder and Flying Flapjack, adding in their press release that they had dropped the project back in 1942 when they had generously passed it over to the US Navy, which had more interest in it.’

‘Christ,’ Stanford said.

‘Okay,’ O’Hara said. ‘Information about the Flounder and Flapjack was released to the public in April 1950 via the *US News and*

World Report, and it touched off some interesting speculations. The first of these arose from the retrospective knowledge that the US Navy had always expressed more interest in a vertically rising aircraft than had the Air Force; that it had, up to 1950, spent *twice* as much money as the Air Force on secret guided missile research; that their highly secret missile-research bases were located around the White Sands Proving Ground – where the majority of the military UFO sightings had occurred – and that, because they were not involved officially in UFO investigations, they could conduct their own research in a secrecy unruffled by the attentions of the public or the media. The next interesting point was that the measurements taken by Navy Commander R. B. McLaughlin and his team of Navy scientist of the UFO they tracked over the White Sands Proving Ground in early 1950 corresponded closely, except for the speed, with the details of the legendary XF-5-U-1, that those details were more or less known to the general public through McLaughlin's published article of that year, and that the US Navy, while refusing to make any comment about the Flying Flapjack project, promptly shipped Commander McLaughlin back to sea.'

'Christ,' Stanford repeated.

'Okay, Stanford, let's look at what we have here. First question: Were the rumors that passed around the CIA about flying saucers having landed on at least three Air Force bases based on fact? Second question: Could it be that the same machines that either landed on, or possibly were being *tested* on, those Air Force bases were the same objects that were frequently being observed over the White Sands Proving Ground area? In short, do we have here a scenario suggesting that the so-called unidentified flying objects are just what they appear to be – and that rather than being of extraterrestrial origin, they're actually the products of the US Navy's secret research activities since the Second World War?'

Stanford fought to control himself. He felt a cold, hard excitement. The facts tumbled like ball bearings in his head with confusing rapidity.

'Was anyone else involved in this?' he asked.

'All I know,' O'Hara said, 'is that in 1954 the Canadian government announced publicly – after having examined the Project Blue Book evidence on the Lubbock sightings of 1951 – that the UFO

observed over Albuquerque was similar to a flying saucer they were then trying to construct but had since, due to lack of know-how and facilities, passed over to the US Air Force. The Air Force naturally claimed that they'd eventually dropped this project as being unworkable.'

Stanford leaned forward to place his face in his hands. He rubbed his eyes and then sat up again and stared straight at O'Hara.

'This all sounds impossible,' he said.

'Impossible? Let's review the facts, Stanford… We have the fact that the majority of the proven unknowns are observed either over desolate countryside or over top-secret military and civilian establishments. We have the fact that crude flying saucers were once constructed by the National Advisory Committee on Aeronautics, that they were one of the US Navy's research projects from at least 1942 to 1947, that similar machines were rumored to have landed on military bases around the White Sands Proving Ground area, and, finally, that the Canadian government claimed to have worked on a flying saucer that was eventually passed on to the US Air Force. And last but no least, we have the fact that when a US Navy commander and his Navy scientists tracked and measured an unidentified flying object over the White Sands Proving Ground – and when that object turned out to correspond very closely to the Navy's Flying Flapjack – that Navy commander was removed from White Sands and transferred back to sea.

'Now let's look at how the Air Force reacted to the most successful UFO investigations. We had, during that time, only three scientifically sound methods of analyzing the speed and dimensions of the UFOs, and, more important, of ascertaining whether or not they were intelligently controlled. The first was Major Fournet's maneuver study of 1952, the second was the Project Blue Book compilation of official unknowns, and the third was Captain Ruppelt's planned visualradar sighting network. Regarding these, the Air Force denied that Fournet's maneuver study ever existed, secreted Project Blue Book's findings behind the Espionage Act, and killed off Ruppelt's visual-radar sighting plan.

'What else did we have? We had an Air Force that insisted that UFOs did not exist, yet made the release of information on that subject to the public a crime under the same Espionage Act. We also had, in

that regulation, a threat not only to military personnel, but to civilian airline pilots and any civilian who happened to know that the regulation existed. We had, more mysteriously, an Air Force which claimed that national security was its only concern, yet ensured that its own air crews and ground crews would *not* report unidentified objects in the sky… What do *you* think it means?'

He stared directly at Stanford, his eyes blue and unblinking, as Stanford sat up straight in his chair, feeling slightly unreal.

'That still begs the question,' Stanford said. 'Is all this *possible*?' 'And the answer must be "yes",' O'Hara said. '*All* things are possible. As you yourself said: in this context we only have to think of the extraordinary innovations in today's science and technology, then remember that such miracles are only the tip of the iceberg, and that what goes on behind the guarded fences of our top-secret establishments is probably decades ahead of what we officially know about. Given this, the speed and capability of the unidentified flying objects are not beyond the bounds of possibility. Also, given this, it is not beyond reason that the UFOs rumored to have landed on various Air Force bases are the products of a military program so secret that only the personnel on those bases know what's going on.'

O'Hara checked his wristwatch, then pressed a button on his desk phone. The door of the office opened and a secretary entered, moving over to stand beside Stanford, very sleek and efficient. Stanford stood up, feeling dazed. He also felt a growing rage. He glanced at the girl, at the paneled walls of the room, at the clear sky beyond O'Hara's head, at O'Hara's broad outline. The facts were amazing. The possibilities were frightening. Stanford looked at O'Hara's sky-blue eyes and let the rage become part of him.

'There the case rests,' O'Hara said. 'Don't come back, Dr Stanford.'

Chapter Sixteen

The New Order was planned and executed with the sort of ferocious drive that only the mystically inclined can possess. Albert Speer was the architect: he created the environment for their vision. In the works of Albert Speer and the other Nazi architects I could see the realization of

Lebensraum in its most concrete form. Lebensraum – space – German conquest and expansionism: the great buildings and the underground factories were signposts to my future.

Himmler showed me Hitler's teahouse. It was on top of the Kehlestein Mountain. The five-mile road that ran up from the Berghof had been hacked out of the side of the mountain by the sweat of slave labor. In the peak of the mountain was an underground passage; at the end of the passage was a copper-lined elevator, its shaft about four hundred feet deep, hacked out of the solid rock. That elevator descended to an immense, high-walled gallery, supported by baroque Roman pillars. At the end of the gallery, also hacked out of the mountain, was a dazzling, glassed-in, circular hall. And standing in that great hall, looking out through the windows, I saw nothing but the other mountains and sky – an overwhelming experience.

The impossible made possible – such was constantly accomplished. If the dreams were grandiose, the actual achievements were more so: the achievements of men who could make the impossible seem commonplace.

The German genius was for organization. In that area it had no peer. Add to this the fact that their well of slave labor was bottomless, and what one had was the dream as a reality. Who built the mighty pyramids? The thousands of Egyptian slaves. The Third Reich had the genius and seven and a half million slaves, and given the combination of these two, all things became possible.

Seven and a half million slaves. Slaves who worked an endless day. Slaves who hacked out the mountains and dug tunnels through the earth and moved rocks and equipment and stores, and never complained. Such were my resources. I could have made Egypt envious. And given that, plus my own grandiose ambitions, there was little I couldn't do.

I was very close to Himmler. He unveiled his great dream. It was a dream of Atlantis reborn from the ashes of war. No Jews or subhumans. A blond SS would rule. In a society of masters and slaves there would be no dissension. Magnificent cities of steel and glass. The pure Aryan predominant. Himmler told me of his dream of a wilderness populated by supermen.

‘How do you build Atlantis? You need masters and slaves. The masters will be the elite of my Death’s Head SS; the slaves will be the Poles and the Czechs and all the other low races. And how do we do it? It is easy, mein freund. We keep building the camps, we ship the Jews there by their thousands, and when the wires of the camps begin to bulge we build more crematoria. Gas the schweine and burn them; let them turn to smoke and ash. When the camps have been cleared of the Jews we bring in the subhumans. The subhumans are the workers. They exist as mere slaves. They live just to work and that work is for the glory of the Reich – the slaves will build the new temples.’

The new temples would be the factories, the universities and laboratories; the new religion would be knowledge and conquest, the return of the Superman. How grandiose the dream! How impressive the rehearsal! Himmler wanted cities under the earth and he set out to create them. He drove me all around Germany. He showed me what could be achieved. I saw the great underground factories and I learned what was possible.

I remember Nordhausen. It had been hacked out of the Kohnstein Mountain. Thirteen thousand slaves from Buchenwald had done it with muscle and sweat. It was empty when I first saw it. The V-2 complex was still to come. It had tunnels eighteen hundred meters long, and nearly fifty side chambers. I gazed about me in wonder. Himmler scratched his nose and smiled. The work area was one hundred and twenty-five thousand meters square, buried deep in the mountain. Himmler showed me around. His voice echoed in the silence. There were twelve ventilation shafts, huge generators supplied the light, and special heating ensured a constant temperature, day in and day out.

‘Here thousands will work. The slaves will live in a separate camp. That camp, which now exists, is hidden deep in a mountain valley, less than a kilometer from the entrance to one of the tunnels. It has every facility. Lots of barracks, a brothel. It has a sports ground and a hospital, a kitchen and a laundry, a psychological and vocational selection unit, a crematorium and prison. There is also the town of Bleicherode. It’s twenty kilometers from here. There, the new tunnels, sixteen kilometers deep, will house several more missile factories and living quarters for thousands. What else

are mountains for? How else do we use the slaves? The new temples will be underground cities that are virtually impregnable.'

I still remember his every word. His voice echoed in that vast silence. I knew that the whole area, from the Harz Mountains to Thuringia, south of Prague and across to Mahren, was littered with similar tunnels and underground factories. Only a few were known to Hitler. Himmler controlled them all. They were cloaked in the strictest secrecy and ruled by the SS. The work went on night and day. All slackers were shot or hung. The underground factories were totally insular colonies, worked by masters and slaves, unrestricted by moral laws, and yet very few Germans knew about them or would ever set eyes on them.

Thus were my problems solved. I saw what could be achieved. Standing there beside Himmler, in that enormous, silent cave, I thought of all the thousands who would work there, and knew where my future lay. Himmler dreamed of ice and fire. He dreamed of cities beneath the earth. He saw the sun flashing off the frozen peaks that showed only emptiness. I would take what Himmler offered. I would hide in glass and stone. I turned around and stared at Himmler's modest eyes and saw his madness as sanity.

'The New Order needs its masters and they have to be Aryan: blonde-haired and blue-eyed and strong – and absolutely obedient. Such are found in the Jungvolk – the boys of ten to fourteen – and they are formed in the Hitler Youth, given the Blood and Honor dagger, retrained to worship the Führer and the Nation, and then join my SS. Once there, they are mine. I do with them what I will. They no longer belong to Hitler, but to me – and they worship me slavishly.'

Himmler dreamed it and did it: he gave birth to his acolytes. The mild chicken farmer blinked his modest eyes and saw a world of godmen. The SS was Himmler's church, his bed and his altar; it was an Order run on Jesuit principles and disciplined with an iron fist. All its members were racially pure. They were bound together by sacred oaths. They were stripped of their history, given numbers instead of names, indoctrinated with the myths of the Volk and emerged as disciples. No questions would be asked. No order would be ignored. Their blind obedience would let them wade through hell without shame or revulsion.

I believed in this approach. Without discipline there is dissension. Himmler's ultimate aims struck me as religious, but his methods were sound. We cannot progress with freedom. Free men are a curse. Such men resist change because it leaves them exposed as superfluous. Himmler understood that much. He feared individuals. He felt that individuals were a threat to his grand masterplan. And what was his plan? He wanted gods, not normal men. He believed in obedience, in controlled breeding and vivisection; believed in biological mutation and its product, the Superman. Such a dream is not uncommon. Modern science still pursues it. Out there, in the world beyond the ice, primitive surgeons hack bone for it. As for myself, I accepted it: men were meat to be used. I believed in biological mutation and used all that was offered.

'The New Order will be purified. The subhumans will be slaves. All dissenters will be stripped of their resistance until they, too, obey. Failing that, they will be removed by gas, gun or noose – and even then, we will ensure that they contribute to the good of the Order. Gouge the gold from their teeth. Use their skin for lampshades. We will turn their bones to ashes and dust in the great crematoria. It is necessary to do so. We must affirm that we are serious. We must let them know that discipline is all, and that their ash can be useful. The New Order will be strict. Its one goal will be progress. It will be dedicated to experiment and research, to the advancement of knowledge. Most laboratories have limitations; this won't be so in the New Order. The subhumans, who are useful as slaves, will also serve us as specimens.'

Not all aeronautics. That went on at Kummersdorft West. In the hangars of Kummersdorft West my other dream took wing. I worked with Schriever and Belluzzo. Perhaps Miethe and Habermohl. I remember the names, not the faces, and I feel no affection. Nonetheless, I worked with them. My restless genius drove me. The vicissitudes of the war did not touch me as my project expanded. How many nights did I go sleepless? I think back on that with pride. I was in my early sixties at the time, but I drove them relentlessly. The first disk took shape slowly. There were many set-backs. I traveled north and south, east and west, stealing men and ideas. Factories hidden in the Schwarzwald. The RLaboratory in Volkenrode. Heated discussions about electrostatic fields and gyroscopic controls. The emerging disk filled the

hangar. Schriever's eyes were filled with greed. The four legs that housed the gas turbine rotors reflected the bright lights. Schriever studied the disk with wonder. This recollection makes me smile. What Schriever gazed upon with such greed and admiration was a primitive toy. The real achievements were in my files. What Schriever saw was nothing. In the hangar in Kummersdorft West I was building a useless thing.

The deceit was necessary. That was no one I could trust. The Third Reich was filled with frightened, ambitious men who yearned to make an impression. I did not trust Rudolph Schriever. I saw the death in Himmler's eyes. I remembered my past, the busy hangars in Iowa, all the businessmen and cowardly politicians who had smothered my life's work. The same thing could happen again. The war would not last forever. Already, in 1941, I saw the Reich's trickling wounds. Just how long would Himmler last? And how long could he keep his secret? I wanted to utilize his masterplan, but what guarantees had I? The Nazis devoured their own kind. They might well devour Himmler. Either that, or the Reichführer would turn on me, destroying all I had gained. Heinrich Himmler: the Reichführer. His mild eyes did not deceive me. His neat fingernails were polished with blood and his smile hid hysteria. No, I didn't trust him. There was no one I could trust. And so I gave him just a little, a prototype that would not work. I kept explaining that I needed more time and that the problems were numerous.

A delicate maneuver. A great cunning was required. The disk had to fool the other engineers while still lacking in something. I used obsolete technologies. I gave the engineers their head. Gas turbines and liquid-fuel rockets were the fruits of their labors. Such toys kept them happy. Schriever's eyes shone with triumph. Young and lean, he showed his drawings to Himmler while I went my own way. Their flying disk had been surpassed. The real achievement was in my files. I gave a little and took a great deal and listened always to Himmler.

'We have our underground factories. We have our chosen location. We have our masters, the SS, and our slaves and your own crystal genius. But that isn't enough. We need more than normal men. What we need is a biological mutation that will lead to true greatness. We must learn to control the workers. Not with whips and not with guns. What we need is automatic

control of their bodies and minds. The human brain must be examined. The body's secrets must be explored. We must try to steal their will and their strength and leave them just what they need. The democracies cannot do this. Regressive morals would forbid it. But here, at the dawn of the new era, there is nothing to hinder us. We must use the Ahnenerbe. We must use the Lebensborn. We must study racial characteristics and breed only the purest. This will solve the first problem. In this way we will find the Superman. Nevertheless, that leaves the problem of the workers, and we must solve that also. Control of mind and body. We must find a whole new method. I think of medical and psychological experiments of the most extreme kind. The camps are yours to command. The schweine there are useless meat. The New Order needs a wealth of mindless muscle and your genius must find it.'

The concentration camps were the laboratories. The prisoners were the guinea pigs. The whole mystery of human life was explored as it writhed on the tables… What are the limits of human pain? How long before the lungs collapse? Will scorched flesh, if left unattended, renew itself or turn gangrenous? Inject this woman with jaundice. Inject that child with typhoid. Shoot this creature with poison bullets, graft a bone, transfer a limb, remove testicles and ovaries and intestines, but don't use anesthetics. Was it the surgery that led to death? Was it death through shock or pain? Put that frozen man between those two whores and then check his responses. More work. (It rarely stopped.) The Ahnenerbe needs human heads. The Institute for Research into Heredity needs anthropological measurements. Take these filthy Jews and Poles. Strip them naked and measure them. If suitable, put them into the gas chambers and then chop off their heads. Ship the heads off in canisters. Use extreme care when packing. Peel the skin from the bones of the corpse, dissolve the bones, use the healthy flesh. This strip decomposed already. A good piece of material there. These tattoos would make a nice lampshade in Frau Koch's bedroom… But such was Nazi frivolity. My true research never stopped. The concentration camps, with their abatoirs and crematoria, were extraordinary laboratories.

'Do you understand at last? The New Order is very real. It will be broken into colonies, each separate, each with its work, all divided into masters and slaves, existing just for the future. What's a colony in our wilderness?

It's just another Nordhausen. You ship the subhumans in to build your underground complex, you control them with your dogs and the Death's Head SS, and then you move in your scientists and technicians and administrators, and you bind them all together with fear of the all-seeing masters. And once there, where can they go? There is no way in or out. They will live underground, seduced by power, cowed by fear, the masters bound by their oaths, by their religious convictions, the subhumans by torture and death and the lack of all exits. Yes, American, it is possible. We are halfway there already. You must work, you must complete your great disk, before we settle the matter.'

So I listened to Himmler. So his droning words encouraged me. Not for long did I think he would survive, but his ideas were valuable. I used him and his facilities. We filled the trains with nameless thousands. The slaves were shipped to the harbor of Keil and then they just disappeared.

Yet I had to be careful. I could not hold back too much. Himmler pressed me for a test flight of the disk, and I had to oblige. It was 1941. I believe it was June. The steel doors of the hangars were pulled open and the sunlight poured in. This much I remember. The disk reflected the sunlight. Schriever climbed into the dome-shaped pilot's cabin, his eyes afire with excitement. The engineers retreated. They all shielded their eyes. Himmler joined me behind the sandbags, his spectacles perched high on his nose. The disk looked like a metallic mushroom. It also resembled a giant spider. Its four legs housed the gas turbine rotors and ran down obliquely. Himmler rubbed at his nose. Sunlight flashed off his spectacles. There was a roar as the hollow legs spewed fire and filled the air with dense smoke. Yellow flames spat from the tarmac. The roar changed into a numbing sibilance as the disk left the ground. Himmler covered his ears. His body seemed to be shrinking. The disk shuddered and shrieked, lifted gently off the ground, hovered briefly and swayed from side to side and was obscured by the swirling smoke. Himmler turned and stared at me. His mild eyes were like the sun. The disk roared and hovered just above the ground as Himmler reached for my hand.

Chapter Seventeen

Richard licked his forefinger and ran it around the rim of his glass. The cigaret smoke curled about him, stinging his bleary, bloodshot eyes, and the noise in the crowded, lunchtime pub was too much for his ears. He kept his gaze fixed on the glass, on the ice cubes in the Coke, but glanced occasionally, with a twisted, bitter smile, at Jenny's unfinished lager.

'Just one drink,' he said.
'No,' Jenny said.
'Just let me have half a pint of bitter. It won't affect me a bit.' Jenny sighed and shook her head, her brown eyes devoid of

humor, tugging distractedly at a lock of her curly hair and gently biting her lower lip.

'No,' she repeated. 'You're not supposed to drink anything. And once you start, you won't know how to stop – you never do anymore.'
'A half pint,' Richard said.
'No. Go to hell.'
'Just give me a sip of yours, for Christ's sake.'
'Drink your Coke and shut up.'
Richard rolled his eyes despairingly, picked his glass up and noticed that it was shaking, held it to his lips with great care, had a sip, put it down again.
'You're still shaking,' Jenny said.
'What do you expect?' Richard replied. 'I haven't had a drink for five days. I'm going out of my skull.'
'You're already out of your skull. You've been that way for a year now. I couldn't take another year like that, so just keep your mouth shut.'
Richard didn't reply to that. There was little he could say. He had drowned the past year in a sea of booze, trying to kill off the nightmares. Now he glanced around the pub, the cigaret smoke stinging his eyes, taking in the pinstripe suits, the black shoes and umbrellas, the pretty secretaries with their hair trailing loosely down their spines, their cheeks flushed with gin or Campari, their breasts thrusting invitingly. They all seemed remote to him, superfluous, unreal, their beauty and vigor redundant, diffused behind frosted glass. Then he looked at Jenny: brown eyes in a moon-shaped face. She was wearing her shabby parka and faded blue denims, her white blouse unbuttoned just above her breasts, her skin creamy and smooth. She seemed

slightly more real, a bit closer, part of him, and the fact that she was still trying to help him filled him with shame.
'A hypnotist!' he exclaimed. 'Jesus Christ! I can't believe I let you persuade me.'
'He isn't a crackpot,' Jenny said. 'He's a psychiatrist and neurologist, a Harley Street specialist, and since he can't possibly make you feel worse than you are, you've nothing to lose.'
'A psychiatrist?'
'Don't look mortified.'
'You actually think I need a psychiatrist? You think I've gone crazy?'
'So what would *you* call it?'
'I'm not crazy,' Richard said.
'All right,' Jenny said, 'you're not crazy… but you're not healthy either.'
'Ah,' Richard said, touching his temple with a finger and turning the finger around like a screwdriver. 'I'm sick in the head.'
'Very funny.'
'Yes, *very*.'
'Listen, Richard, you're not going to see a witch doctor. He won't beat on his jungle drums.' Jenny reached into her shoulder-bag, withdrew a packet of cigarets, used her lighter with a jittery, angry movement and threw it back in her bag. 'What's bugging you?' she said. 'The man's just a fucking doctor. This is 1975, for God's sake: it's routine these days.'
Richard flushed and looked away and studied the glasses above the bar, hurt and embarrassed by her statement, but accepting the truth in it. The past year had been a horror, a gradual sinking into madness, the days viewed through the prism of booze, the nights strung out on nightmares. The police interview hadn't helped, had in fact made it worse, their disbelief filling him with shame and deepening confusion. Now the wheel had turned full circle. He was himself loath to accept it. More and more he was resisting the idea that the incident had actually occurred.
'Listen to me,' Jenny said. 'I don't really think you're crazy. I just happen to believe you're mentally ill and you have to be cured. You used to drink like a normal person. I mean, you had the odd wild night. But you never *needed* to drink like you need to these days – and you need it too much. You just can't go on like this. It won't do you any good. You've already given up art school, you're living off unemployment benefits, and you haven't seen your family or friends in close to a year. What kind of life's that? You're only

nineteen, for God's sake! You've been seeing your normal doctor for mysterious rashes and headaches, and you're washing the pills down with red wine… You've got to sort yourself out, pal.'
Richard sipped his iced Coke, ran his fingers around the glass, looked up and shrugged his shoulders in defeat, his smile tight and pained.
'I suppose you're right,' he said.
'No bloody question about it.'
'I haven't seen too much of you either.'
'Don't blame that on me.'
Richard glanced around the pub and saw the beer glinting golden, the flushed faces of the men and women lined along the bar counter. Their conversation was noisy, a meaningless lunchtime repartee, and he felt a sudden sweeping isolation, as if no longer part of them. Had the incident occurred at all? Had he imagined the whole damned thing? The instant he considered this, he felt a fear that made his heart start pounding. Returning his gaze to Jenny, he saw her stubbing her cigaret out. She smiled when she glanced at him, her brown eyes as large as spoons, and again he felt that secret, gnawing shame that had now become part of him.
'I'm getting better,' he lied.
'Don't talk shit,' Jenny said.
'No, really,' he insisted, 'I'm getting better. I don't think I need this.'
'Richard, he's only a *psychiatrist*.'
'I don't care. I feel stupid.'
'Damn it, he often deals with *crazy* people… You'll probably seem halfway normal.'
'It's all bullshit,' Richard said.
'What's bullshit?'
'Hypnotism.'
'You ever tried it?'
'No. Of course not.'
'Then what the hell do you know?'
Richard shrugged and glanced around him, seeing the upper-class brigade, the men with pinstripe suits and umbrellas, the women like fashion models. What was he doing here? He didn't want to be here. He felt a slowly uncoiling desperation that threatened to choke him.
'What good will it do me?'
'You won't know until you try.'

Jenny pushed her chair back and stood up with a determined movement, brushing her auburn hair from her forehead and avoiding his gaze. Richard sighed and raised his hands, an indecisive, weak gesture, but Jenny, ignoring him, turned away and walked out of the pub. Cursing quietly, he followed her out and found her standing on the pavement, exhaling cigaret smoke, her lips pouting attractively, her parka falling below her thighs, around the faded blue denims. She flounced off along the street, shaking her head in an angry gesture, turning the corner at Baker Street station as if no longer caring. Cursing softly again, Richard hurried after her, pushing his way through the crowds. He caught up with her as she passed the Planetarium and Madame Tussaud's.

'Okay!' he said, spreading his hands in a gesture of surrender. 'I apologize. *Okay*?'

'Don't bother,' she responded. 'I don't want your fucking apology. I just want you to visit that psychiatrist. That's all I ask.'

'Okay, Jenny, you win.'

She stopped at York Gardens, the wind blowing her hair, her face pale and her lips a tight line, the brown eyes large and luminous. 'Okay,' she said. 'Fine.'

They crossed Marylebone Road, passing a wall of stalled traffic, then walked silently along the opposite pavement, neither touching the other. Richard stayed a little behind, feeling nervous and confused, taking note of the gray streets, the stately rows of Georgian buildings, his throat dry and crying out for a drink, for the soothing oblivion. He needed that oblivion. He didn't want to go back. What had happened was in the past and should remain there, buried deep and forgotten. He didn't want to relive it, didn't think he could stand it, and yet walking behind Jenny, following her into Harley Street, he knew that she was right, that he had to face up to the problem; that he had to tear the veil from the mystery that kept him in chains.

'This is it,' Jenny said.

She had stopped at a tall, flat-fronted Georgian house with a black door and polished brass handle. Richard stared at the door, at the names on the brass plate, and a tremor of dread rippled through him and congealed in his throat.

'Oh, well,' he said.

'Are you going in?' Jenny asked.

‘Yes,’ he said, ‘I guess I’m going in. Jesus Christ, I feel dumb.’
Jenny pressed the bell, her face closer to a speaker built into the wall, and a voice, distorted and indistinct, lazily drawled the word ‘Yes?’ Jenny gave Richard’s name, the tinny voice said, ‘Come up,’ then the door made an irritating buzzing sound that signified they could open it. Richard pushed the door open, letting Jenny pass through first, then he stepped in and closed the door behind him and the buzzing noise ceased.
‘The third floor,’ Jenny said.
They stood together in the hallway, its walls paneled in varnished wood, a thick dark-gray carpet on the floor, a potted plant near the front door. Richard stared at the elevator, at its polished metal door, and experienced a fleeting claustrophobia that made him shake slightly. He glanced uneasily at Jenny, at the high, ornate ceiling, at the stairs that curved behind the elevator and climbed past faded paintings. The fear crept steadily over him, devoured him, made him numb, and he felt himself dissolving where he stood, drifting free from his body. He didn’t want to go up there, didn’t want to relive the incident; he wanted to turn around and walk out, but it was too late for that.
‘We’ll use the stairs,’ Jenny said.
Richard just nodded, a dumb gesture of agreement, seeing her brown eyes through a film of panic, her head turning away from him. Then he followed her up the stairs, moving slowly, reluctantly, his eyes fixed on her blue-denimed legs, the high heels of her boots, the wrinkles where the parka curved out around her broad, swaying hips. It was coming back to him already, the white haze, the silhouettes, the woman with red hair and green eyes – the whole nightmarish catalogue. Richard started shaking, felt anxious and confused, his heart pounding dramatically, glancing down to see his booted feet on the carpet, sinking into deep pile. Then they reached the third floor, a gleaming elevator gate, a forbidding silence surrounding them. Jenny stopped at a door, raised her hand, let it dangle there for a moment, then she turned back and took a step toward him and gently embraced him.
It was a sad, instinctive gesture, an expression of love and doubt, a silent affirmation of her loyalty and commitment to him. Taken aback, Richard stood there, his hands at his sides, feeling the warmth of her body, her reality, and wondering what he could do with it. Then he slid his arms around her, felt her shoulder blades, her spine; he spread his fingers and

pressed her closer to him and laid his cheek on her head.
‘It’s all right,’ he whispered.
She clung to him for another moment, her fingers scratching his back, her thighs and firm breasts molded to him before moving away. Then she glanced at him, her smile hesitant, eyes shadowed, and nodded and disappeared down the stairs, leaving scent in the air.
Richard stood there for some time, deeply moved, reawakened, closing his eyes and covering his face with his hands and taking deep, painful breaths. Then he put his head back, studied the ceilings ornate moldings, shrugged and knocked lightly on the door and heard a voice bid him enter.
He stepped inside, closed the door quietly behind him, saw walls of lime-green, a glass table, comfortable armchairs, a middle-aged woman behind the desk, looking up, smiling pleasantly.
‘Mr Watson?’
‘That’s right.’
‘You’re a punctual patient,’ the woman said. ‘Dr Campbell’s expecting you.’
She pressed a button on the desk, her hand milky-white and elegant, and announced Richard’s presence to Dr Campbell, speaking softly, precisely. Richard glanced around the office, not listening, not really present, still aware of Jenny’s warmth in his clothes, touched again with emotion. Then the woman stood up, a white blouse, a neat gray skirt, and opened the door to another office and motioned him in. Richard coughed into his fist, trying to orientate himself, then he brushed past the woman, smiling at her, avoiding her gaze, and heard the door closing behind him with a sharp, clicking sound.
‘Ah! Mr Watson!’
‘Yes,’ Richard said.
‘Do you mind if I call you Richard?’
‘No.’
‘Good.’
Dr Campbell wore a gray-striped suit, a white shirt and a vividly colored yellow tie. His hands were spread out on his desk, cuff links glittering, what looked like a wedding ring on one finger. His hair was dark and fashionably long, tumbling carelessly on his forehead, lines of humor around bright blue eyes, his teeth possibly capped. He was in his late thirties, suntanned and clearly healthy, a handkerchief protruding from the pocket of his jacket,

pressed and neatly folded.
‘Please,’ he said. ‘Sit down.’
Richard did as he was told, taking the chair in front of the desk, crossing his legs and then uncrossing them again and resting his hands in his lap. He glanced distractedly around the office, saw the same limegreen walls, some reproductions of Turner, a few framed diplomas, the doctor framed by a window.
‘Have you ever been to a psychiatrist before?’
‘No,’ Richard said.
‘Have you ever been *hypnotized* before?’
‘No,’ Richard said.
‘And does the thought of it bother you?’
‘Yes,’ Richard confessed.
‘Why?’
‘I don’t know. It just seems stupid. I don’t think it will work.’ ‘You don’t believe you can be hypnotized?’
‘No,’ Richard said.
‘Why not?’
‘I just don’t believe it,’ Richard said. ‘I don’t think I’m the type.’
Dr Campbell smiled. ‘You just don’t believe it,’ he repeated. ‘You don’t think you’re the type. Is that why you think you can’t be hypnotized?’
‘Yes.’
‘Well, we’ll see.’
Campbell looked down at his desk, at a gray manila folder, opened the folder and pulled out some papers and thoughtfully studied them. Richard just sat there, feeling nervous and slightly vague, trying to seem a lot more casual than he was, wanting to get up and run.
‘An interesting case,’ Campbell said, glancing up from the papers. ‘You’ve clearly had a pretty bad year. How do you feel now?’
‘Okay,’ Richard said.
‘Are you nervous?’
‘Yes.’
‘Well, that’s normal. It means you’re still human.’ Campbell smiled at Richard, raised his hand and studied his ring, glanced down at the papers again and then looked back up. ‘It says here you’ve been drinking a lot.’
‘Yes,’ Richard said.
‘And you still have to drink?’

‘Yes.’
‘Why?’
‘I don’t know.’
‘And the nightmares?’
‘What about them?’
‘According to these notes, all your nightmares are exactly the same.’
‘So?’
‘So you’re not just dreaming… You’re repeatedly reliving the same incident.’
‘You mean, *you* think the incident was real?’
‘Not necessarily,’ Campbell said. ‘It *could* be a case of autosuggestion, brought on by great stress.’
‘You think I’m crazy, is that it?’
‘Not remotely. I’m just saying that whatever happened during your period of amnesia could have led to this particularly vivid hallucination.’
‘Okay, I’ll accept that. That’s fine. Now how do you cure me?’
‘You really accept that statement?’
‘Yeah. Sure.’
‘Rubbish. Of course you don’t. You’re just saying that because you want to get out of here and go for a drink.’
Richard shrugged and spread his hands in surrender. ‘Okay, Doc, have it your way. Just tell me what you want me to say and I’ll gladly oblige.’
‘I just want you to say what you believe.’
‘I don’t believe anything. I *don’t know* what to believe. The whole business happened a year ago, and that’s a very long time. I told the cops about it. They laughed me out of their office. When I tried to tell anyone else, they just assumed I was crazy – and I think they were right. It couldn’t have happened. Things like that just don’t happen. So I really think you’re right – that I had some kind of blackout, and that during that time I hallucinated and then thought it was real. I don’t *care* what it was. I just want to forget it. I want to get rid of those nightmares and sleep soundly again.’
‘I didn’t say it was hallucination. I said it *might* be.’
‘I hallucinated. Believe me, that’s what happened. Now how will you cure me?’
‘You said you feel okay now.’
‘I was lying. I feel rotten.’
‘You mean physically?’

‘I mean mentally… I mean, I have trouble sleeping, I have the nightmares when I *do* sleep, and I keep breaking out in rashes and get very bad headaches. And I think it’s all part of the same thing.’
‘Yes,’ Campbell said. ‘I have your medical records here. You never had such ailments before the alleged incident… and they *are* quite peculiar.’
‘Peculiar? What do you mean by that?’
‘They’re not caused by anything physical. The rashes and the headaches are psychosomatic: brought on psychologically.’
‘That’s ridiculous,’ Richard said.
‘No, Richard, it’s not ridiculous. People can *will* rashes and headaches… and fevers and ulcers and heartburn and stomach upsets and skin diseases… in fact, just about anything.’
‘I’m not a hypochondriac.’
‘I wasn’t suggesting that at all.’
‘That’s what it sounded like to me.’
‘No. Not hypochondria.’ Campbell sat back in his chair, placed his hands behind his head, put his feet up on his desk and smiled pleasantly. ‘Let me tell you about the human brain,’ he said. ‘The first thing to note is that the human brain, while undoubtedly being a remarkable instrument, is rarely used at even a *tenth* of its full potential. Now, most of our bodily functions are actually controlled by the brain – the brain tells us what to do, when to do it and how to do it – so what we see, hear, smell and feel are merely the colors, sounds, smells and sensations that the brain has *selected* as being most necessary. This selection isn’t arbitrary – the brain selects what it assumes we need – but there are other sensations which, though being actual, are beyond the limited range of our immediate senses. However, by awakening certain dormant areas of the brain, either electrically, by the use of drugs, or through hypnotic suggestion, the scope of both our senses and our capabilities can be dramatically expanded.’
‘I can’t see what this has to do with me.’
‘Well, I’ll tell you. Would you agree that drugs or electrical stimulation of the brain can change human behaviour?’
‘Yes.’
‘Fine. Now did you know that these methods of affecting the brain can also induce pain and similar experiences?’
‘Yes. I’ve read about it.’
‘Okay. Well, regarding hypnotherapy we can apply the same principles, the

only difference being that the sensations are induced – or recalled – by a process of suggestion, rather than by physical means. In other words, just as through hypnotism a patient can be directed to go to sleep or awaken, feel a nonexistent pain or ignore applied pain, turn as rigid as a plank or relive long forgotten experiences, and generally do things that he would not normally contemplate – so, too, can the average human being actually *will* himself into pain, depression or serious illness, not believing for the slightest moment that he's doing it, convinced that it's physical.'
'I don't believe that,' Richard said.
'Don't you?' Campbell said. 'Do you know that a perfectly normal person, if told under a hypnotic trance that he has just been scalded, will actually come out in blisters? Do you know, further, that this same person, still in the hypnotic trance, can be burned or pierced with needles, experience no pain at all, and not be marked by the burning or piercing when snapped out of the trance state?'
'No, I don't believe that either.'
'Believe me, Richard, if I hypnotized you and told you that you were a wooden plank, you would turn as staff as a plank, could be stretched out across two supports, and wouldn't budge if a couple of people used your groin as a springboard… You would simply *become* a plank.'
'Bullshit,' Richard said.
'No, lad, not bullshit. These are the realities of autosuggestion, tested and verified. So when I tell you that your ailments might be psychosomatic, self-induced, I'm not suggesting for a moment that you're a hypochondriac… I'm merely saying that the ailments are a symptom of a deeper disturbance.'
Richard crossed his legs, uncrossed them, scratched his knee, then distractedly looked down at the floor and looked up again.
'So,' he said, 'what are you going to do about it?'
'I'm going to try to take you back to when you suffered the amnesia, find out what really happened during that lost three days, record what you tell me when you're in the trance state, and then play the recording back to you.'
'I don't want to know,' Richard said.
'You have to know,' Campbell said.
'I don't give a fuck,' Richard said. 'I don't want to know.'
He was shocked by his own vehemence, sitting upright in the chair,

flushing, his heart pounding dramatically, his throat abruptly constricting. Campbell looked thoughtfully at him, not showing surprise, then placed his feet back on the floor and propped his chin in his hands.
'What frightens you?' he asked.
'I just don't want to do it.'
'Why not?'
'I'm not dumb enough to be hypnotized. I don't believe in it. It won't work.'
Campbell smiled patiently. 'Well, now,' he said, 'I think you're antagonistic because you feel that being hypnotized is degrading. Let me therefore assure you, Richard, that any intelligent adult and most children over the age of seven can be hypnotized, that only the mentally retarded and the psychotic can *resist* being hypnotized, and that hypnotizability is in no way a sign of weak will. Indeed, the more intelligent and imaginative the individual, the better a subject he'll be. You therefore needn't feel ashamed. There's nothing *wrong* in being hypnotized. Just think of it as another branch of medicine - and try to accept it.'
Richard crossed his legs, uncrossed them, scratched his knee, licked his lips, glanced distractedly around the office and then studied the floor. He thought of the past year, of the nightmares and the drinking, of the loss of his friends, of Jenny's rage, of his own failing health. He couldn't live like that much longer; it just didn't make sense. He wanted to kill it off or be cured, but the fear held him back. He looked up at Dr Campbell, tried to speak but failed, so finally stood up and scratched his left ear and then shrugged in defeat.
'What do I do?' he asked.
Campbell smiled and stood up. 'Excellent,' he said. 'I just want to try a few of your reactions and see if you're suitable.' He came around the desk to stand directly in front of Richard, gazed into his eyes, then stepped away and said, 'Look at your wristwatch.' Richard did as he was told. The time was four thirty. 'Keep your hands by your sides,' Campbell said, 'and just relax, just hang loose.' Richard did as he was told. He thought that Campbell was pretty foolish. Feeling sorry for Campbell, he decided to humor him to save him embarrassment. Campbell kept talking. He kept telling Richard to relax. He said, 'Clasp your hands together,' and Richard did so, wanting to humor him. Campbell kept on talking. He told Richard to relax more. He said, 'Your hands are clasped together and you won't be

able to open them, no matter how hard you try.' Richard didn't bother trying. He wanted to humor Campbell. Campbell told him he could pull his hands apart, so Richard pulled them apart. Campbell told him to raise his right arm. Richard did as he was told. Campbell pinched his right arm and Richard didn't feel a thing because he didn't want Campbell to be embarrassed. Campbell told him to lie down. Richard lay down on the couch. Campbell told him to relax and Richard lay there and felt slightly amused. Campbell told him to close his eyes. Richard grinned and closed his eyes. Campbell told him to open his eyes again and look at his wristwatch. Richard opened his eyes. He raised his hand and studied his wristwatch. He blinked and then looked at his wristwatch once more. The time was four thirty. A whole hour had passed. Richard shook his head in disbelief and sat up on the couch, feeling vague but refreshed.
'How do you feel?' Campbell asked.
'Fine,' Richard said.
'How long do you think you've been asleep?'
'I haven't been sleeping.'
Richard looked again at his wristwatch . It was definitely four thirty. He shrugged and grinned foolishly, stood up and stretched himself, then went behind Campbell's desk and sat down and scribbled his name on a notepad.
'Why did you do that?' Campbell asked.
'I don't know,' Richard said. He stood up and walked back around the desk and stopped in front of Campbell. 'Did you tell me to do it?'
'Yes,' Campbell said. 'You've been asleep for an hour. You were obedient and you talked an awful lot and it's all down on tape.'
'Can I hear it?'
'No.'
'Why not? You said I could hear it.'
'That's before *I* heard it,' Campbell said. 'You're not ready yet.' He went to his desk, switched the tape recorder off, then sat down and scribbled something on the notepad and then looked up at Richard. 'I want you to go home now,' he said. 'You should go to bed early. With a bit of luck, you won't have any nightmares and you'll get a good sleep. I want you to come back here next week. My secretary will give you an appointment. When you return, I'll say something that will put you to sleep immediately, and the experience will be as painless as it was today. I'm taking you back gradually. I can't do it too quickly. This means you'll be coming back on a

regular basis, for quite a few months. I don't think this will bother you. In fact, you'll probably want to come. At the end of the sessions, when all the pieces are together, you can hear what happened during those missing days. Okay? See you next week.'

Campbell pointed to the door and Richard left. The secretary gave him another appointment. He took the elevator down and stepped out into the street and headed straight for Baker Street station, melting into the jostling crowds. The journey home was uneventful. He changed trains at King's Cross. The train was packed and the light stung his eyes and he felt very calm. He got out at Finsbury Park, feeling bright and exhilarated. There were drunkards in the long, tunneled exits that led up to the buses. Richard boarded the W7, bought his ticket and sat down, looked outside and saw darkness descending, the street lights flickering on. The bus took him to Crouch Hill. He stepped out and felt the cold. He walked along the dusty pavement, turned into a driveway, passed the parked cars and entered the apartment block, feeling strangely lightheaded. He opened the front door and closed it quietly behind him, then he went along the corridor and stopped when he came to the bedroom. Jenny was stretched out on the bed, fully dressed, her eyes open. Richard approached the bed and stopped there, saying nothing, just smiling. Jenny reached up for his hand. Their fingers locked and she pulled him down. Their tears mingled as they undressed one another and melted together. Richard poured himself into her. His remaining fear was drained away. He was surrounded by her arms, by the cradle of her thighs, and there, on that bed of flesh and bone, he slept the sleep of a child.

Chapter Eighteen

James S. Campbell, BA, MA, MD c/o Society of Medical Hypnotists 4, Victoria Terrace Kingsway, Hove Sussex, England

February 14, 1976

Dr Frederick Epstein
Aerial Phenomena Investigations Institute Massachusetts Avenue
Washington, DC
USA

Dear Frederick, Further to our telephone conversation of this morning, I am enclosing a transcript of the most recent taped hypnotic session with young Richard Watson. I am doing this with his permission. I should remind you again that there have been a total of eighteen hypnotic sessions over a period of approximately six months, that the editing of the transcripts has been undertaken as a means of eliminating repetitions and verbal ambiguities, and that the complete tapes of all sessions can be heard in my Harley Street office upon your arrival in London. In the meantime, here is the background you requested. Richard Watson first presented himself at my office on 9 September, 1975, at the recommendation of a professional colleague (the father of the young man's girlfriend) and with the approval of his personal physician. The patient had been suffering from persistent nightmares, insomnia and acute anxiety, all originating in a three-day period of amnesia which apparently began on the evening of 7 March, 1974, when the young man, and an unknown lady who was driving him at the time, experienced what he believed was a close encounter with extraterrestrials. The alleged incident took place on the A30 on Bodmin Moor in Cornwall.

According to the young man's original story to both his doctor and the Tottenham Court Road police (the medical records and a photocopy of the police interview are enclosed), the incident began when the car, being driven by its female owner, cut out and rolled to a standstill in a desolate area between Bodmin and Bolventor. Almost immediately, a strange aircraft described by the patient as 'enormous' descended vertically and released two three-feet diameter flying disks. These disks circled the car, appeared to be examining it by remote control, then shot 'beams of light' into it, allegedly stunning the woman, and then flew away to re-enter the 'mother' ship.

Shortly after this (mere minutes) two larger flying disks emerged from the mother ship and also circled the car. According to the patient, these disks were piloted by strange creatures, they also shone beams of light into the car, and those beams of light appeared to *pull* on the car and draw it toward the mother ship. At this point the mother ship descended, vertically, almost to ground level, appeared to split along the bottom, and then the car, by mysterious means, was drawn up into it. The period of amnesia appears to have begun at this moment,

ending three days later when the patient awakened and found himself on a hill in *Dartmoor* – approximately thirty miles from the scene of the alleged incident. Neither the woman nor her car were to be seen. According to the medical report, the patient could remember nothing of his 'missing' three days, but was suffering numerous nightmares, all of which were obviously related to the period immediately prior to the beginning of the amnesia. As a consequence of the amnesia, or of the alleged incident itself, the patient became alcoholic, suffered either insomnia or nightmares, developed severe headaches and skin inflammations (usually around the face and neck) and also succumbed to acute depression and anxiety.

Regarding this, it is to be noted that the young man's physician described him as being, prior to the incident, highly intelligent, emotionally stable, and imaginative.

The patient was, at the time of the incident, a student at the Hornsey College of Art in North London, where he was studying to be a graphic designer, but he dropped out shortly after the incident and is now living off what you Americans call 'Welfare.'

According to the police, young Richard reported the incident about a week after it allegedly occurred. According to Richard himself (a story repeated under hypnosis), he was held in the police station all night and then interviewed, the following morning, by two men in plain clothes who claimed they were from a government data department. Also, according to Richard's conscious and unconscious statements, the men who interviewed him told him that they had already located the female driver of the car, that she had denied the whole incident, and that she described Richard as being extremely drunk when she dropped him off near Bodmin. Richard was, in fact, drunk at the time, but insisted, even under hypnosis, that the incident had actually occurred and that the woman had been a witness to it.

It was shortly after the interviews with the police and government officials that Richard, obviously depressed and less confident about the reality of his experience, began to develop the headaches and skin inflammations. As you can judge from the transcripts, the skin inflammations might well be psychosomatic manifestations of the 'burn mark' on his neck which he believes was caused by one of the so-called extraterrestrials.

For the following sixteen months Richard continued suffering the nightmares and attendant insomnia, and subsequently his drinking increased. During this period he was regularly seeing his doctor for unsuccessful treatment of the headaches and skin inflammations. Dissatisfied with Richard's progress, his doctor recommended psychiatric treatment, which Richard was reluctant to undertake. Then, in late August, 1975, his girlfriend's father, my friend and colleague Dr Robert C. Parker, recommended that he come to me for hypnotherapy. The first session was, as I have stated, on 9 September, 1975, and there were eighteen further sessions, the most recent being on 10 February this year.

The reality or nonreality of UFOs is hardly my province; I therefore centered my treatment on the patient's anxiety reaction to the amnesia which formed part of the alleged experience. Since Richard had obviously developed a strong aversion to the thought of reliving the experience, I was forced to attempt a penetration of the amnesia by taking him gradually through the three prime stages of hypnotism: light, medium and heavy, the latter being a state of somnambulism. The treatment has so far been successful only to a limited degree.

As you will notice when you read the transcript of the most recent hypnotic session, there is a point beyond which the patient simply refuses to go – and to try to force him to do so could be dangerous. Whether the amnesia is a means of obliterating a real experience or an extremely painful fantasy is, in a certain sense, immaterial; what matters is that the memory appears to be real to the patient and that the climax of the experience, or hallucination, was obviously traumatic. It is therefore to be noted that in the period between the last two hypnotic sessions – during which I attempted by suggestion to break down the patient's resistance to a total recall – his mental and physical condition have degenerated, with a full return of the headaches and skin inflammations. These symptoms have naturally led to a return of the patient's former acute anxiety.

This regression, brought about by the patient's fear of a total recall, has so far made me reluctant to use Sodium Amytal or Pentothal to facilitate the breakthrough. However, should such a breakthrough fail to occur during the forthcoming hypnotic session, which is scheduled for tomorrow, I feel that these alternatives will have to be risked. Since the

events leading up to the period of amnesia are detailed in the enclosed police and doctor's reports – and since these events have been corroborated by the patient's recall under hypnosis – the attached transcript covers only the most recent hypnotic session, during which the patient finally recounted what happened during the period of amnesia. As you will note, there is a point beyond which the patient still refuses to go.
I look forward to seeing you upon your arrival here in London. Yours fondly,
James S. Campbell

PATIENT: Richard Alexander Watson AGE: 19 yrs. 7 mths.
SYMPTOMS: Nightmares, attendant insomnia and acute anxiety centered around a three-day period of amnesia.
HISTORY: See attached police and medical reports, both released unofficially and in confidence.
DOCTOR: James S. Campbell

SESSION 18/February 10, 1976
DOCTOR

You are relaxing, relaxing, you are very relaxed. You are sleeping, deep sleep, sleeping deeper, very deep. You are sleeping, very comfortable, relaxed, very relaxed, you are deeper and deeper in sleep, very comfortable, deeper. You are relaxed and comfortable. You are deep, deep in sleep. You are relaxed and you will remember everything and you will answer my questions.
RICHARD

Yes.
DOCTOR
All right, Richard. You are going back to the evening of March 7, 1974. You are going back now.
RICHARD
Yes.
DOCTOR
Do you know where you are?
RICHARD

I am in the car. The woman is beside me. The car has stopped… a roaring sound… a humming… I don't know… And the light… Oh, my God, it's all white! *The whole sky is exploding*!
DOCTOR
It's all right. It won't harm you. Calm down. Relax. You can see it. Are you all right? Can you see it?
RICHARD
Yes.
DOCTOR
All right, Richard, we've already discussed how you were given a lift by the woman in the Audi, how the car stalled in the middle of Bodmin Moor, how the sky became bright, and how the car was eventually drawn into the large saucer. Before discussing what happened inside the saucer –
RICHARD
I don't want to remember that.
DOCTOR
Before discussing what happened inside the saucer, I would like to clarify some points about the previous period. I want us to do this, Richard.
RICHARD
Yes.
DOCTOR
I want to start with the emergence of the two smaller, three-foot diameter disks from the larger craft.
RICHARD
Yes.
DOCTOR
You said that the two smaller disks flew around the car as if they were examining it.
RICHARD
Yes.
DOCTOR
Why do you think they were examining the car?
RICHARD
They were humming. They made some whistling sounds… Not whistling… Strange, high-pitched beeping, almost like Morse Code. They made me think of computers. I was thinking of computers. I had the feeling they were examining the car, photographing it, making some kind of calculations.

DOCTOR
That's a strange thing to think. Why did you think that? RICHARD
Because of the way the disks circled the car. Because of the sounds they were making. Because they shone lights into the car and the car began to shake and a beam of light fell on the woman's eyes and made her act strangely.
DOCTOR
She changed when the beam of light struck her?
RICHARD
Yes.
DOCTOR
How?
RICHARD
She was very frightened initially. She seemed paralyzed with fear. Then the beam of light caught her in the eyes and she changed almost instantly. I remember this clearly. I was fascinated by it. The woman gasped and then shuddered, closed her eyes and settled back, then, when she opened her eyes again, she was remarkably calm. She told me not to be frightened. She kept saying, 'It's all right.' She stared at me as if I didn't exist, and she seemed almost happy. I thought that was strange. DOCTOR
Why didn't the light affect you that way?
RICHARD
It didn't reach my eyes. I doubled over on the seat. The light passed over the back of my head and just burned my neck.
DOCTOR
I see. Please continue.
RICHARD
Then the small disks flew away. They returned to the large object. Each disk went into a separate opening. Then the panels at each end of the large object winked out, leaving darkness.
DOCTOR
Describe the large object, the large saucer, again.
RICHARD
It was dark, but it grew bigger. It was surrounded by a glowing haze. The colored lights along the bottom started flashing on and off, and I could see the object itself very clearly. It was definitely solid. It appeared to be made of white metal. It had long, narrow windows running right along the front,

curving back on both sides, as if running right around the whole object, as if the object was circular. There were people at those windows. I couldn't see them in any detail – they were just silhouettes. They were moving to and fro across the windows, pretty small, faraway. That object, that saucer, was immense. At least three hundred or four hundred feet wide, two or three stories high.
Fine, Richard. Then the two panels opened again and two more flying saucers emerged.
RICHARD
Yes.
DOCTOR
Describe them, please.
RICHARD
They flew straight at the car. They hovered just above the ground. There was one on either side of the car and I saw that they were different from the previous ones. They were an awful lot bigger. About thirty-five feet in diameter. Their perimeters swept up to form a dome made of something like glass. There were people inside.
DOCTOR
That's right. You mentioned two crew members.
RICHARD
Two crew members in each saucer.
DOCTOR
How far away was the saucer nearest to you?
RICHARD
The part of the circular perimeter closest to me was about three feet from the car. And the glass dome, maybe Perspex, about fifteen feet away, was just a little above the level of my head.
DOCTOR
You more or less looked directly at the crew members? RICHARD
Yes, I looked directly at them.
DOCTOR
You are relaxed. You are very relaxed. You have nothing to fear. I want you to remember. I want you to remember it clearly. I want you to tell me what the crew members looked like.
(*The patient does not immediately respond*.)
DOCTOR

There is nothing to fear. You are relaxed. Tell me what the crew members looked like.
(*The patient moves into the present tense*.)
RICHARD
Strange. They look strange. They look strange and I'm frightened.
DOCTOR
There is nothing to fear. You are relaxed. What do they look like?
RICHARD
No lips. A mask. It must be a mask. The cabin dome has a rippling effect, so it must be a mask.
DOCTOR
What else?
RICHARD
It has to be a mask. The nose is metallic. The nose is made of metal – it's covered in metal – so it must be a mask.
DOCTOR
Go on.
RICHARD
The eyes are just slits. They seem a bit Oriental. I think they're slits, but this could be the rippling effect again. They seem Oriental. DOCTOR
And their faces?
RICHARD
White. Very wrinkled. Sort of gray.
DOCTOR
White or gray? Be specific.
RICHARD
Sort of gray. Very wrinkled. It looks like dead skin. It doesn't look like human skin at all. I have the feeling it's dead skin.
DOCTOR
Dead skin?
RICHARD
I don't know… It made me think of a corpse.
DOCTOR
Think very hard. Is there anything else you can tell me about the crew members, the pilots?
RICHARD

Oh, Jesus, he's just lifted up his hand! He's lifting I up right now! Oh, Jesus Christ, *the hand is a metal claw*!

Easy, relax, deep deep sleep, very deep sleep, very deep, you are very relaxed, you have nothing to fear… Now can you tell me anything else about the pilot?
(*The patient reverts to the past tense*.)
RICHARD

He raised his hand. No hand. A metal claw. A sort of metal replacement.
DOCTOR

A prosthetic hand?
RICHARD
I don't know what that is.
DOCTOR
Never mind. He raised his hand as you were looking at him. Then what?
RICHARD
I woke up.
DOCTOR
What do you mean, you woke up?
RICHARD
I woke up.
DOCTOR
You weren't asleep, Richard.
RICHARD
I must have fallen asleep. He raised his hand and then a beam of light hit me and then I blanked out.
DOCTOR
All right, Richard, let's assume you blanked out. How long do you think you were unconscious?
RICHARD
Not long. Just a few seconds.
DOCTOR
How did you know that?
RICHARD
The saucers were still outside the car. They were still in the same position.

The woman was still in the same position. She seemed to be in a trance.
Fine. What happened next?
(*The patient reverts to the present tense*.)
RICHARD
Oh, God, it's coming down! The big mother ship's coming down! Its lights are all flashing and it doesn't make a sound and it's dropping down slowly, too slowly, not making a sound. Oh, God, *there it is*! DOCTOR
Where is it?
RICHARD
Oh, God! *Oh, my God*!
DOCTOR
Relax, relaxed, you are relaxed, you are comfortable, you have nothing to fear, you are relaxed, you can tell me.
RICHARD
Yes,
DOCTOR
Where is the mother ship, Richard?
RICHARD
It's settled just above the ground. It's hovering just above the road. It's close to the road, but no on it – it's sitting just above it. DOCTOR
It's now in front of the car?
RICHARD
Yes.
DOCTOR
It's straddling the road?
RICHARD
Yes.
DOCTOR
How far away is it?
RICHARD
It stretches right across the road. It's resting just above the road. It's about fifty yards from the car and it's really enormous… Oh, God, *the car's shaking again*!
DOCTOR
It's all right, it's all right, the car's shaking. Why is it shaking? RICHARD
Everything's shaking. The whole car's going wild. Everything's flying about inside the car and sticking to the windscreen… I can't breathe, I'm

choking, all this stuff's flying around me, the car's shaking and moving forward, no sound, just moving forward, being pulled by the saucers at both sides, being drawn toward the mother ship. DOCTOR
What's pulling the car forward, Richard?
RICHARD
The saucers. The saucers on both sides. They're pulling us forward?
DOCTOR
How are they pulling you forward?
RICHARD
I don't know. I think it's the beams of light. The beams of light come from the saucers, they're shining on both sides of the car, and the saucers are moving toward the mother ship and pulling us with them. DOCTOR
Beams of light or cables?
RICHARD
Not cables. Not rope. Nothing! Just beams of light.
DOCTOR
Do you really believe that, Richard?
RICHARD
Yes, I believe it. The beams of light are drawing us forward and… Oh, Jesus, *it's opening up*!
DOCTOR
The mother ship is opening up?
RICHARD
Yes, the mother ship is opening up. It's splitting along the bottom, just above the flashing lights… It's *not* splitting open: it's forming a ramp. The bottom part's dropping down to become a ramp leading up into the mother ship and the car is being drawn up and inside… Oh, my God, *it's all white in there*! All those people… *Oh, Jesus*!
DOCTOR
All right, Richard, you are relaxed, very comfortable and safe, deep deep in sleep, very relaxed, very comfortable, peaceful, you have nothing to fear. You are being drawn up into the mother ship, but you have nothing to fear. You are relaxed and can remember everything. You are being drawn up into the mother ship. What happened next? (*The patient does not immediately respond.*)
DOCTOR
What happened next, Richard?

RICHARD
I'm on the hill. I'm cold. I don't know where I am. I… DOCTOR
You are not on the hill, Richard. You are jumping ahead. You are in the car with the woman and you are being drawn into the mother ship. Now what happened next?
(*The patient does not immediately respond*.)
DOCTOR
Can you hear me, Richard?
RICHARD
Yes.
DOCTOR
What happened next, Richard?
RICHARD
I'm on the hill. I'm cold. I don't know where I am. I… DOCTOR
You're skipping ahead, Richard. You are three days ahead. Go back to when you were drawn into the mother ship. What happened then?
RICHARD
Oh, God, it's all white! It's all white! It's so bright! All the people! Silhouettes! This is crazy! Oh, Jesus, oh God, I don't want to! *I don't want to*! *I don't want to*!
DOCTOR
Relax, you will relax, you are relaxed, you have nothing to fear. You are sleeping, deep sleep, sleeping deeper, very deep. You are deep, deep in sleep. You are relaxed and comfortable. You are relaxed and you will remember everything and you will answer my questions. RICHARD
Yes.
I want you to tell me what you believe happened during the missing three days.
RICHARD
I don't know.
DOCTOR
But you think about it a lot?
RICHARD
Yes.
DOCTOR
Would you like to know what happened?
RICHARD

Yes. No! I don’t want to know.
DOCTOR
You just said you would like to know.
RICHARD
I want to know. I don’t want to know. The thought of it frightens me.
DOCTOR
It won’t frighten you if you discuss it. It won’t frighten you anymore. You can remember without feeling any fear. You will remember. You are remembering.
RICHARD
Yes.
DOCTOR
You are in the car. You are in the car with the woman. The car is being drawn into the mother ship and you see the white light. Do you see the white light?
RICHARD
Yes.
DOCTOR
The car is being drawn into the mother ship and you see the white light and silhouettes. Do you see the white light and silhouettes? RICHARD
Oh, Jesus!
DOCTOR
Do you see the white light and silhouettes?

Oh, Jesus ! *Oh, no*!
DOCTOR
You are relaxed, very relaxed, deeply relaxed, there is nothing to fear. You are deep, deep in sleep, you are relaxed, and nothing can harm you. You are all right. You can answer my questions. Do you see the white light and silhouettes?
(*The patient does not immediately respond*.)
DOCTOR
Can you hear me, Richard?
RICHARD
Yes.
DOCTOR
The car is being drawn into the mother ship. You can see the white light and

silhouettes. Now I want you to recall everything that happened. Tell me what happened.
RICHARD
All white.
DOCTOR
White?
RICHARD
Everything.
DOCTOR
Please explain that, Richard.
RICHARD
The walls are all white and the place is filled with light and the light is so bright it temporarily blinds me. That's all I can see. The white walls, the bright haze. The silhouettes are moving all around me, moving in on the car.
DOCTOR
Go on.
RICHARD
I'm starting to see better. The place is really very bright. The silhouettes are men in coveralls, moving in on the car. Most of the men seem very small. They all seem about five feet tall. They're wearing one-piece coveralls, some black, others a silvery-gray, and they have this sort of gray, wrinkled skin, metal noses, no lips.
All right. You are comfortable. You have nothing to fear. You say they have metal noses, no lips. Just what do you mean by that? RICHARD
Metal noses. No lips.
DOCTOR
They're wearing masks like the other crew members?

RICHARD

I don't know. I'm not sure. (*The patient reverts to the past tense*.) They looked like masks, but they seemed permanent. The masks covered their nose and the lower half of the chin and seemed to be molded out of a single piece of very thin metal. That's why there were no lips. The metal covered their lips. I could see the wrinkled skin on their foreheads and around their strange eyes.
DOCTOR

Strange eyes?
RICHARD
Oriental.
DOCTOR
You mentioned that before. Anything else?
RICHARD
The eyes were like the skin – they seemed dead.
DOCTOR
They were blind?
RICHARD
No. They eyes were looking at me, but they seemed dead. DOCTOR
All right. So these creatures surrounded the car.
RICHARD
Yes.
DOCTOR
What happened then?
RICHARD
They opened the doors of the car and pulled us out.
DOCTOR
They had to pull you out?
I don't understand.
DOCTOR
Did they have to pull you out because you were frightened? RICHARD
They didn't actually pull us out. This creature opened the door and took me by the arm and just sort of assisted me.
DOCTOR
You didn't resist?
RICHARD
No.
DOCTOR
I thought you were frightened.
RICHARD
I was numb. I think I was numb with fear. I was dazed and felt weak. I got out automatically.
DOCTOR
And the woman did the same?
RICHARD

I don’t know. I wasn’t looking. I assume she did the same. I saw her standing beside me, fascinated, looking around her, smiling with that strange gleam in her eyes.
DOCTOR
Could she have been in a trance?
RICHARD
She could have been. Not quite. She was wide awake. DOCTOR
Posthypnotic suggestion?
RICHARD
I don’t know what that means.
DOCTOR
It doesn’t matter. The creatures pulled you out of the car. Where was the car?
RICHARD
The car was inside the mother ship.
DOCTOR
You’re sure of that?
Yes. I looked around me and saw the ramp swinging up to form part of a wall. The ramp swung up from the floor. It closed and formed part of the wall. It didn’t make a sound when it closed, and then I saw the wall properly. The wall was white. It was very slightly curved. It curved horizontally and vertically to form part of a dome. It was only part of the dome. It was shaped like a slice of orange. It was very large, very white, very bright, like part of a painted aircraft hangar. DOCTOR
What made you think of an aircraft hangar?
RICHARD
I was in an aircraft hangar once. I remember that hollow ringing sound. The car was parked on the kind of ramp that you see in a garage, and the whole place looked like an aircraft hangar, a sort of very large workshop.
DOCTOR
You saw machinery?
RICHARD
Yes.
DOCTOR
What sort of machinery?
RICHARD
I don’t know. I don’t know much about machinery. It just seemed like an

aircraft hangar because it had all this machinery and because it was big and sort of echoing. Also, all the men, the creatures, were wearing the coveralls.
DOCTOR
And the curved wall? What did you think it was?
RICHARD
It was just a curved wall. It was the inside of the outer wall of the mother ship, where the ramp had come down.
DOCTOR
Okay. So the car was drawn up the ramp into the mother ship, the ramp was then drawn up to form part of the wall, and the car came to rest on a sort of platform close to the inner wall.
RICHARD
Yes.
Fine. Now you and the woman are standing beside the car, surrounded by the men, the creatures, in coveralls.
RICHARD
Yes.
DOCTOR
What happened next?
RICHARD
I look at the creatures around me, wondering if they were wearing masks, metal masks, and my fear deepened and I started to shake. The one of the creatures approached me. Oh, Jesus, those dead eyes! He stared at me and passed his hand across my face and then I felt a lot better.
DOCTOR
You weren’t frightened anymore?
RICHARD
I went sort of limp. I mean, I went limp inside. I just emptied out, feeling drained and light-headed, a bit removed from it all. It became like a dream.
DOCTOR
Yet you still felt awake?
RICHARD
I was aware of where I was. It just seemed more distant and unreal, as if I was dreaming.
DOCTOR
Were there any distinct sounds in the hangar?
RICHARD

A humming. A sort of humming vibration. All the time. It was constant.
DOCTOR
Was this similar to what you'd experienced in the car? RICHARD
Similar, but almost imperceptible. I hardly heard it at all. DOCTOR
Heard it or felt it?
RICHARD
Both.
Did the creatures talk to you?
RICHARD
No. No lips.
DOCTOR
They made no sound?
RICHARD
No.
DOCTOR
Go on.
RICHARD
There was an escalator near the car. They made us go up the escalator. One creature walked ahead of us, another stayed behind us, and a third took my elbow and guided me to the escalator.
DOCTOR
What did the others do?
RICHARD
They surrounded the car.
DOCTOR
Why did they surround the car?
RICHARD
I don't know. I didn't look back.
DOCTOR
All right. The creature guided you and the woman to the escalator. What then?
RICHARD
The escalator door opened and the creature pushed us inside and followed us in. The other two then followed him in. The escalator took us up past plain white walls to a corridor that curved out of sight. DOCTOR
The corridor ran parallel to the curved wall of the mother ship? RICHARD
Yes, I think so. It think it ran around the rim of the whole ship. DOCTOR

Any windows?
RICHARD
No windows on the right-hand wall, the outer wall, of the corridor. There were doors on the left. These doors were the kind that slide in and out of hollow spaces in the wall – they didn't swing back on hinges. DOCTOR
Go on.
RICHARD
Surrounding us, the three creatures walked us along the curving corridor, past a lot of closed doors, and then, when we reached a particular door, the leading creature ordered us to stop.
DOCTOR
Just a moment, Richard. You say the leading creature ordered you to stop?
RICHARD
Yes.
DOCTOR
But you said previously that these men never spoke.
RICHARD
They never spoke. They had no lips. The metal covered their lips.
DOCTOR
Yet you say one of them ordered you to stop.
RICHARD
Yes.
DOCTOR
How did he do that? Did he speak to you?
RICHARD
He didn't talk. He just told us. I just knew.
DOCTOR
Did you actually *hear* him?
RICHARD
He told us to stop. I must have heard him.
DOCTOR
You think you heard him? You heard a voice in your head? RICHARD
I don't know. I just heard him.
DOCTOR
But you're convinced that this man, this creature, didn't actually speak?
RICHARD
He didn't talk. I just heard him.

DOCTOR
Okay. You are standing at one of the closed doors.
(*The patient reverts to the present tense*.)
RICHARD
The door opens. It seems to open automatically. It slides open, disappearing into a hollow in the wall, and we step through the doorway. The door makes me think of ships. It's like the hatchway of a ship. We step in and the door closes behind us and we're in a dimly lit room, a circular room, the walls white… Oh, my God… *I don't want to*! DOCTOR
It's all right, you are relaxed, very relaxed, deep, deep in sleep and relaxed. You can see and tell me.
RICHARD
It's eerie.
DOCTOR
Yes. The room is circular and dimly lit.
RICHARD
The wall is white and completely circular. There are beds forming a circle around us. There are people on the beds, ordinary people, men, women and children, and they're all wrapped in surgical gowns and have wires running out of them.
DOCTOR
Wires?
RICHARD
The wires are taped to them. Wires and rubber tubes. All these things trail back to the wall behind the beds and are fixed to machines. The machines have colored screens. Not colored: a sort of monochrome. I thought at first they were colored because I saw lines of bright light jumping up and down.
DOCTOR
Have you ever seen an ECG monitor?
RICHARD
I think so. In the movies.
DOCTOR
Is that what these machines look like?

(*The patient reverts to the past tense*.)
RICHARD

Yes. The room looked like a hospital ward – except for its shape. DOCTOR
The circular shape.
RICHARD
Yes.
DOCTOR
Okay. Continue.
RICHARD
We were led to the far side of the room and taken through another door, and we entered another circular room, but bigger and brighter. There were a couple of surgical beds – no, like operating tables. There were people around the beds and the walls were all lined with long glass cabinets… *Oh, please God, I don't want to*!
DOCTOR
It's all right, you are relaxed, you are deep, deep in sleep, you are very relaxed and you can tell me, you have nothing to fear. What is it that you didn't want to do?
(*The patient reverts to the present tense*.)
RICHARD
I don't want to look at them.
DOCTOR
At what?
RICHARD
I don't want to look at the glass cabinets.
DOCTOR
Why don't you want to look? What do you see in the glass cabinets?
RICHARD
People. Naked people. There are naked people in the glass cabinets. The glass cabinets are like coffins, the glass seems to be slightly frosted, and the naked people are lying in the cabinets with tubes running out of them. Oh, God, *I can't look at them*!
DOCTOR
All right, Richard, it's all right, you're relaxed, you don't have to look at them. Relax, Richard. I just want to go over something I might have missed. In the room you've just come from, where the people were lying on the beds, did any of those people actually speak to you? RICHARD
No. They couldn't. They were unconscious.
DOCTOR

And the people in the frosted glass cabinets?
RICHARD
I don’t want to look at them!
DOCTOR
It’s all right, Richard. You don’t have to look at them again. Just tell me: Are they unconscious?
RICHARD
They’re unconscious or dead.
DOCTOR
Do you see anything that looks like an ECG monitor?
RICHARD
Yes. There are screens like that above and between the glass cabinets.
DOCTOR
Are the lights on the screens jumping up and down?
RICHARD
Yes.
DOCTOR
Fine. That means they’re alive.
RICHARD
They’re alive. They’re unconscious.
DOCTOR
Fine, Richard. Now tell me about the people in the room. The ones standing around, fully conscious.
RICHARD
They’re ordinary.
DOCTOR
They look like normal human beings?
RICHARD
Yes.
DOCTOR
Please describe them.
RICHARD
The two nearest to me seem pleasant enough. They’re smiling at me and the woman who drove the car. One is tall and slim, white hair, suntanned, I think in his late forties or early fifties, but his forehead is unlined. It looks unusually smooth.
DOCTOR

That was the only oddity you noticed?
RICHARD
He was ordinary, but his forehead was unlined.
DOCTOR
And the other man?
RICHARD
He has no hair on his head. He looks normal, but he's bald. He seems older than the other man – not much, but a bit older – and the skin on his face seems unreal, as if he's had plastic surgery. DOCTOR
Do you know what the results of plastic surgery look like? RICHARD
Yes. I had a friend who was badly burned in a traffic accident. (*The doctor deliberately reverts to the past tense*; *the patient does the same*.)
DOCTOR
Were there any other people in the room?
RICHARD
Yes. There were four other men, all wearing white smocks and trousers, pretty young, adolescents I think, quite small, foreign looking. DOCTOR
Explain that, please.
RICHARD
They looked like Vietnamese. Something like that – I wasn't sure. They had peculiar eyes, narrow, Oriental… I'm not sure. It seemed unreal.
DOCTOR
You still felt as if you were dreaming?
RICHARD
I never felt as if I was dreaming. It was just different, somehow. I didn't feel frightened anymore. I felt nothing. Removed from it. DOCTOR
Did any of these men talk to you?
RICHARD
They talked to the creatures who'd brought us there. They made them all leave. The men in white stood all around us, but they never said anything. The two standing close to us spoke to us.
DOCTOR
The same as before?
RICHARD
Pardon?
DOCTOR
Did you just hear their voices in your head or did they speak to you orally?

RICHARD
They were normal. They spoke to us. They spoke to me and the woman. They were pleasant and they asked us how we felt and I said I felt fine.
DOCTOR
Did you feel fine?
RICHARD
No. I felt weak. I felt very removed. I was confused and I felt half asleep, as if not really there.
DOCTOR
So why did you tell them you felt fine?
RICHARD
I just said it. I didn't want to upset them.
DOCTOR
What did the woman say?
RICHARD
She didn't say anything. She just smiled.
DOCTOR
What did the men sound like when they talked?
RICHARD
They sounded normal. They were both speaking English. The younger man, the tall one, had a normal English accent – a sort of everyday American accent – but the older man spoke English like a foreigner. His English was very good, very good, but he had a strange accent.
DOCTOR
What kind of accent?
RICHARD
I don't know. It sounded slightly European. I think it might have been German.
DOCTOR
What else did they talk about?
RICHARD
They talked quite a bit. They wanted to know all about us. Our names, our ages – things like that – and they were very polite. The old man was fairly distant. He watched more than he talked. I had the feeling he was older than he looked, and he seemed pretty cold. The younger man was more informal. I think he said his name was Wilson. He kept asking us how we felt, if we were frightened, and he seemed really pleasant. The woman didn't say

anything. I said I felt very tired. The man I think was called Wilson asked me if I knew where I was, and I confessed that I didn't. He asked me if I'd like to know. I said that I would. He walked over to the wall and pressed a button and two white panels slid apart. There was a very large window there. I went over and looked out. I thought at first that what I was looking at was a painted screen… and then I became really scared.
DOCTOR
It's all right. There's no need to be scared. Now what did you see?
RICHARD
Stars.
DOCTOR
Pardon?
RICHARD
Stars. Lots of stars. No real sky – just the stars. No up or down, left or right, just the stars in a blackness. Then the stars moved. The Earth suddenly filled the window. The curved edge of the Earth, wreathed in cloud, blue and white – like those movies the astronauts sent back… It all seemed too fantastic.
DOCTOR
You were above the atmosphere?
RICHARD
Yes. I could see Brazil and the Argentine. We were way up in space.
DOCTOR
Are you sure this wasn't some kind of an illusion?
RICHARD
Illusion?
DOCTOR
You said that at first you thought it was a painted screen. RICHARD
At first I thought it had to be. I think I was hoping that. I wanted it to be a painting or a film, because the other thing frightened me. DOCTOR
What other thing?
RICHARD
Actually knowing that I was up there.
DOCTOR
Did the man at the window say anything at this point? RICHARD
I asked him where we were. He said we were up in space. He said we were landing briefly in Paraguay and then flying on.

DOCTOR
Flying on to where?
RICHARD
He didn't say. I didn't ask him.
DOCTOR
Didn't you want to know?
RICHARD
I didn't think of asking. I was frightened. I think I was frightened.
DOCTOR
You said before that you weren't frightened anymore. RICHARD
I can't explain it. I wasn't as frightened as I should have been. I felt a bit unreal, I felt drugged… but there was fear. A sort of fear in the background. The fear was just there, if somehow distant… I just wanted to please them.'
DOCTOR
You say you felt drugged. Did you feel they had some control over you?
RICHARD
I felt that I didn't control myself. I felt kind of helpless. DOCTOR
You were looking down at the Earth. What happened next? RICHARD
The man, the younger man, pressed the same button and the two panels closed again. Then they took the woman away. I mean, the bald man took her away. I think I must have looked a bit worried, because the younger man tried to reassure me.
DOCTOR
The one called Wilson.
RICHARD
Yes. He told me they wanted to examine the woman and that she wouldn't be harmed. He said that the bald man was going to examine her and that he – I mean Wilson – wanted to examine me. He said it wouldn't hurt. He said it was just routine. I don't know why, but that really reassured me. It seemed a natural thing to do.
DOCTOR
You didn't wonder why he wanted to examine you?
RICHARD
I think I might have. I can't remember it clearly.
DOCTOR
Why can't you remember it clearly?
(*The patient reverts to the present tense*.)

RICHARD
I just can’t. I’m trying to think. I’m more tired than ever. I’m suddenly feeling very tired, so I stretch out on the bed.
DOCTOR
Are you still inside the spaceship, Richard?
RICHARD
Yes.
DOCTOR
Has Wilson told you to lie on the bed?
RICHARD
It’s more like an operating table.
But has Wilson actually told you to lie on it?
RICHARD
I think he must have. I can’t remember. He passes his hand over my face and I lie down. I’m feeling really tired.
DOCTOR
Go on.
(*The patient does not respond*.)
DOCTOR
I said, continue.
(*The patient does not respond*.)
DOCTOR
Can you hear me, Richard?
RICHARD
Yes.
DOCTOR
You are lying on the operating table. What happens next? (*The patient now alternates between past and present tenses*.) RICHARD
I woke up.
DOCTOR
You were asleep?
RICHARD
I woke up. I must have been asleep. I am in another room and the man, the one called Wilson, is shaking me awake. This room is very small. It’s relatively small. There are only two beds and the woman is on the other bed. She’s unconscious. She’s wearing a metal cap. There are wires running out of it, their other ends plugged into a monitor above the bed.

DOCTOR
How long were you sleeping?
RICHARD
No time. There is no sense of time. I just feel very drowsy. DOCTOR
So, the man shakes you awake.
RICHARD
No. He's just there. I waken up. The man doesn't touch me.
Yes.
RICHARD
He's still pleasant. He smiles at me. I'm frightened because of the way he's smiling. It doesn't seem natural that he's pleasant, and I feel really scared.
DOCTOR
Did he say anything?
RICHARD
He smiled and then asked me how I felt. I said I felt very tired. He said that was all right, that it was natural to feel tired, and that I had very strong will, great resistance, and would have to come back. I didn't know what he meant. I said I didn't understand. He told me that I didn't have to worry, that I was going home soon. I said I didn't understand. I asked him where I was. I felt drugged and I asked this automatically, not thinking about it. I asked him where I was. He said if I got up he would show me. I got up and he led me out of the room and we passed through a laboratory.
DOCTOR
A laboratory?
RICHARD
A laboratory. It looked like a laboratory. It frightened me because of what was in there and I tried not to look.
DOCTOR
What frightened you?
RICHARD
The big jars. The things in cages. All the things in the big jars. The big jars were filled with a clear liquid and these things were just floating there. I felt a bit sick. I was even more scared. I didn't recognize half of these things, but I still felt upset.
DOCTOR
You didn't recognize half of the things. What *did* you recognize?
RICHARD

Eyeballs. Tongues. Maybe brains – I'm not sure. Things that looked like liver and intestines… things that made me feel ill. DOCTOR
Were these items from humans or animals?
RICHARD
I don't know. I didn't look much… There was a corpse on a table, a human corpse, but its head was missing.
DOCTOR
Anything else?
(*The patient does not respond*.)
DOCTOR
Can you hear me, Richard?
RICHARD
Yes.
DOCTOR
You mentioned cages. What was in the cages?
(*The patient does not respond*.)
DOCTOR
It's all right, Richard. You have nothing to fear. You are asleep, deep, deep in sleep, you are relaxed, you will be calm. You have nothing to fear, you will be calm, relaxed, you are calm. You are relaxed. Can you hear me?
RICHARD
Yes.
DOCTOR
What was in the cages?
RICHARD
Heads… *Human heads*!
DOCTOR
It's all right, Richard, forget it. You have forgotten it. You are calm, relaxed, you are just passing through. Remember: I want you to remember. Are you still in the laboratory?
RICHARD
We passed the laboratory. We continued along a curving corridor. The man was telling me that I would come back some day and that I should at least see it.
DOCTOR
See what, Richard?
RICHARD

Where we were.
DOCTOR
You mean you were still in the mother ship?
RICHARD
No, I don't think I was still in the mother ship.
DOCTOR
What made you think that?
RICHARD
The walls of the corridor were solid rock. They had been hacked out of the rock. The corridor led into a giant workshop with walls of sheer stone. This place was really enormous. Not a mere workshop – a kind of factory or machine-shop, filled with workers and machines. DOCTOR
What kind of machines, Richard?
RICHARD
I don't know. Large machines.
DOCTOR
You are in the machine-shop. What else did you see?
RICHARD
The walls were stone or rock. The roof was stone or rock. I think it was underground. In the ground. Maybe deep in a mountain. DOCTOR
Anything else?
RICHARD
I can't really remember. I can't remember it clearly. There were lots of machines, lots of people, hundreds of people, men and women, and there were catwalks running around the stone walls, catwalks above one another, running past what looked like giant computers, past brightly lit rooms. It looked like a factory. An underground factory. The people all worked like automatons. Hundreds of people.
DOCTOR
These people looked like normal human beings?
RICHARD
All the people looked normal.
DOCTOR
What else did you see?
RICHARD
He showed me where we were. He took me up some steps to a platform and then pressed a button. There were steel panels on the wall. The steel panels

slid apart. There was a really huge window, like a CinemaScope screen, and the panels slid apart to expose it, and I saw where we were.
DOCTOR
Where were you?
RICHARD
I don't know. He wouldn't tell me.
DOCTOR
All right, Richard, what did you see?
RICHARD
Ice.
DOCTOR
I'll repeat the question: What did you see?
RICHARD
Ice. All ice. Hills and valleys of ice. The sun was shining and it flashed off the ice and the light nearly blinded me.
DOCTOR
Nothing but ice?
RICHARD
No. There was nothing but ice. Ice, maybe snow, a bright sky, very blue, the sun beating down and flashing off the ice and turning the ice into prisms. It was incredibly beautiful. It took my breath away. There was nothing out there but the ice and the bright, flashing light. The ice went out to the horizon. The sky was sheer blue. I looked up at the sky and saw a green valley surrounded by more ice. The ice was everywhere
– down below, in the sky – and I stared at it and thought it was beautiful and that really frightened me.
DOCTOR
Why did it frighten you?
RICHARD
Because I knew that it must be another world, that I was far, far away.
DOCTOR
It looked like another world?
RICHARD
It had to be another world. There was nothing like that on Earth. It was simply incredible.
DOCTOR
But the man, this Wilson, refused to tell you where you were? RICHARD

I asked him. I had to ask him. He wouldn't tell me.
DOCTOR
What did he say?
RICHARD
He said I would find out soon enough. He said we had to go back now.
DOCTOR
Back to where?
RICHARD
I thought he meant back to the mother ship, but I couldn't be sure.
DOCTOR
Okay, what next?
RICHARD
He pressed the same button and closed the panels. He said he thought I had seen enough. He said that I wouldn't remember this, that I might remember some of it, but that whatever I remembered would be confused and wouldn't mean much to me. Then he repeated that I had great resistance. He said that was interesting. He said that most people forget it, but that I might be different. He thought I was interesting. He wanted me to come back. He said that when I ceased my resistance I would be very useful. After that, we went back along the corridor. DOCTOR
Wait a minute, Richard. What do you think he meant by all that? RICHARD
I don't know.
DOCTOR
You didn't think about it?
RICHARD
I didn't remember it.
DOCTOR
All right. You went back along the corridor.
RICHARD
We went back along the corridor, through the laboratory, then into another room. There were a couple of surgical beds. The men in white smocks were there. The leader, the man called Wilson – I think he was the leader – told me to lie down on a bed. It wasn't a bed: it was an operating table, with a metal cap attached to its headrest. I didn't want to lie on it. I lay on it and the men moved in around me and then one of them pulled the metal cap down. I didn't want them to do that. I didn't want them to *do* that! I tried to resist, but I can't move as they put the metal cap on my head. I don't *want*

them to do that! *I don't want to I don't want to*! I don't want them to put that on my head, oh please God… *I don't want to I don't want to I don't want to*!
DOCTOR
It's all right, Richard, you are calm, you are safe, you are relaxed, you are deep, deep in sleep, it's all right. Are you calm now? (*The patient does not respond*.)
DOCTOR
Can you hear me, Richard?
RICHARD
Yes.
DOCTOR
What happened next, Richard?
(*The patient does not respond*.)
DOCTOR
What happened next, Richard?
RICHARD
I'm on the hill. I'm cold. I don't know where I am. I… DOCTOR
You are not on the hill, Richard. You are jumping ahead. You are on the operating table and they are placing the metal cap on your head. Now tell me what happened.
(*The patient does not respond*.)
DOCTOR
There is nothing to fear, Richard, you can tell me, you will tell me what happened.
RICHARD
I'm on the hill. I'm cold. I don't know where I am. I… DOCTOR
Deep, deep sleep, you are deep, deep in sleep, you are relaxed, you have nothing to fear, you are very relaxed… You are on the operating table. They are placing the metal cap on your head. You have nothing to fear, you are relaxed, you can tell me what happened. What happened, Richard?
(*The patient does not respond*.)
DOCTOR
You can tell me, you have nothing to fear, you are relaxed, you can tell me. What happened, Richard?
RICHARD
No.
DOCTOR

You can tell me, you have nothing to fear, you are relaxed, you can tell me. What happened, Richard?
RICHARD
I didn't want to lie down. I lay down. I didn't want to be there. I lay there and the men all stood around me and one of them pulled the metal cap lower. I didn't want them to do that. I didn't want them to *do* that! I try to resist, but I can't move and they're putting the metal cap on my head. I don't *want* them to do that! I don't want to I don't want to! I don't want to have that thing on my head, oh please God, *I don't want to I don't want to I don't want –*
DOCTOR
It's all right, Richard, you are calm, you are relaxed, you are deep, deep in sleep, it's all right, you can tell me… What happened, Richard? (*The patient does not respond*.)
DOCTOR
Can you hear me, Richard?
RICHARD
Yes.
DOCTOR
What happened next, Richard?
(*The patient does not respond*.)
DOCTOR
What happened next, Richard?
RICHARD
I'm on the hill. I'm cold. I don't know where I am. I… DOCTOR
All right, Richard, we'll leave it for now. You are in deep, deep sleep, very deep, deep sleep, you are relaxed, you are very relaxed, you are sleeping, deep sleep, In a moment you can wake up. You will remember nothing that has been said between us. You will not remember until I ask you to remember, you are asleep, deep deep sleep. All right, Richard, you are wakening now, you are wakening, wakening slowly, you are very slowly, gradually, wakening. You can wake up, Richard.

Chapter Nineteen

Looking out of the rear window of the large, comfortable London taxi, the first thing that struck Epstein with pleasure was the peculiar beauty of the

pearly-gray afternoon light, falling now, through a drifting layer of clouds, on the stately grandeur of Parliament Square, on the Guildhall and Big Ben, on the tourists who milled about on the pavements dominated by statues. Epstein loved the English light. He had loved it since the war. There was something about that mild, misty gray that pacified the most fearful soul.

'How do you like being back?' Campbell asked. 'It's been an awfully long time.'
'How long?'
'About ten years,' Campbell said. 'You came over quite a lot in those days. You were a regular tourist.'
Epstein smiled and rubbed his eyes. The taxi was passing the Cenotaph. He gazed at the Foreign Office, at Downing Street and the Treasury Buildings, saw more tourists around Horse Guards Parade, the soldiers stiff in red uniforms.
'There were a lot of conferences then,' he said. 'There isn't much happening now. The British are very secretive about UFOs, so there's normally no point in coming.'
'It's better in America?'
'For good and for ill. But once you sort the wheat from the chaff, then, yes, it's better.'
Sitting beside Epstein in the back of the taxi, wearing a pinstripe suit, polished black shoes and a flamboyant tie, Campbell studied the glittering ring on his finger and nodded judiciously.
'I know what you mean,' he said. 'We British are tight-lipped. The Official Secrets Act blankets all; we're not as free as we think we are.'
The taxi was pulling out of Whitehall, into the dense traffic of Trafalgar Square, the four lions staring eternally, flocks of pigeons above the fountains, Nelson's Monument soaring to the cloudy sky, the National Gallery beyond it. Epstein studied the scene with some sadness, recalling other days, better days, when he had felt more assured, his youthful innocence shielding him. Those days were gone forever and would never return. They had slipped away quietly, stealing hopes and good health, leaving him more restless and defeated, overwhelmed by shrinking future possibilities. He didn't want to think of the hospital. He couldn't pretend to be that brave. He coughed into his fist and looked out and saw the steps of the church.

‘St Martin in the Fields,’ Campbell said.
‘What are those people doing there?’
‘Some sort of demonstration,’ Campbell said. ‘They often demonstrate there.’
The light was different here, darker, subtly tainted with carbon monoxide: the waste of the traffic that endlessly circled the square and caused chaos in the surrounding West End streets. Epstein rubbed his tired eyes, slumping deeper into his seat, suffering the acute disappointment that comes to old men when they discover that the past has slipped away and cannot be recaptured.
‘It’s a pity about Stanford,’ Campbell said. ‘I’m really sorry he couldn’t come. It’s not like him to miss a trip to London. You must he keeping him busy.’
‘He didn’t want to come this time,’ Epstein said.
‘Stanford? You can’t be serious.’
‘I’m serious. He didn’t want to come. He’s been a bit obsessed lately.’
‘Don’t tell me he’s in love.’
‘It’s not a woman,’ Epstein said.
‘With Stanford it’s *always* a woman… and our young friend can pick them.’
Epstein smiled. ‘You sound disappointed,’ he said. ‘Anyway, it really isn’t a woman. He’s obsessed with his work.’
‘You mean UFOs?’
‘That’s right.’
‘That doesn’t sound like Stanford.’
‘Stanford’s changed a lot,’ Epstein said. ‘He’s not the man you remember.’
‘You believe the UFOs are real?’
‘Yes, I believe they’re real. And now Stanford… he thinks they’re real as well, and it’s made him obsessed.’
As the taxi slowed down at Cambridge Circus, inching carefully into the traffic, Epstein glanced out and saw the shuffling crowds, the gutters littered with rubbish. The city was less enchanting here, packed with modern shops and fast-food cafes, the pervading grayness no longer romantic, enshrining neglect. Everything changed, Epstein thought, decayed, visibly crumbled, and he turned his eyes away to gaze inward, ashamed of his dark thoughts.
‘Those transcripts were remarkable,’ he said. ‘What’s your assessment?’
‘I agree with you,’ Campbell said. ‘It’s an amazing story. I’ve gone over the

tapes time and time again, but can't come to any kind of conclusion.'
'Why not?'
'I'm simply confused. I don't know what to believe. It's the most incredible story I've ever heard to come out of hypnosis, and I'm afraid it's left me rather baffled.'
'Is it a true experience or isn't it?'
'It's a true experience to *Richard*.'
'But that doesn't necessarily mean that it actually happened?'
'No, I'm afraid it doesn't.'
Epstein sighed and stared out at Tottenham Court Road, feeling weary after his flight from New York to Heathrow, a slight nausea in his stomach, his head throbbing, a little dizzy from jet lag.
'It's a very elaborate story,' he said. 'He always returns to the exact same story. If the story isn't true, what can it mean? Why does he *believe* that it's true?'
'I'm not sure,' Campbell said. '*Something* traumatic obviously happened to him when he was hitchhiking to Cornwall, and it's possible that he's just trying to conceal it.'
'From himself?'
'Yes.'
'Even under hypnosis?'
'Yes, even under hypnosis. They can be pretty tricky.'
Epstein glanced outside again to see the shops with plate-glass windows, an abundance of tape-recorders and televisions and stereo equipment, the audio and visual stimuli of a society increasingly divorced from its senses. There was input and output. The Western world was being programmed: plug in, turn on and forget that the real world exists… Yet what was the real world? Where did fact and fantasy blend? Young Richard Watson's experience was real to him – and yet may never have happened.
'All right,' Epstein said. 'Let's suppose he's hiding something. He's been shocked and he can't face up to it, so he creates his selfprotecting fantasy. Yet, if that's true, what would make him think of UFOs? He'd never *thought* about UFOs before, so why think of them now?'
'It's not true that he'd never thought about UFOs before. He thought *occasionally* about UFOs. Like most of us, he'd read about them and discussed them now and then – not often, but he definitely must have done it, so they were there in the back of his mind.'

‘Hardly enough to make him switch on to UFOs to explain his amnesia.’
‘Well, there *is* something else,’ Campbell said. ‘A few weeks back I had a quiet conversation with Richard’s father, and he gave me some interesting information. It seems that Richard’s father – an engineer with British Leyland – was a Royal Air Force navigational pilot during World War Two. When Richard was a child his father used to tell him about the mysterious balls of fire that were seen by a lot of pilots and have since gone down in the literature as the first genuine reports of contemporary UFO sightings. What we’re told, we remember… so Richard could have remembered those UFO stories.’
‘Anything else?’
‘Yes. According to Richard’s father, he used to embellish his stories – just to scare the hell out of young Richard – by telling him that the balls of fire were actually flying saucers, that they were piloted by extraterrestrials, and that the extraterrestrials had a secret base in the Antarctic, from where they made all their forays.’
‘That’s an old UFO myth,’ Epstein said.
‘Precisely.’
‘So you think that this might account for the landscape of ice and snow that Richard talks about?’
‘Yes. There *is* a pattern there. First he remembers the balls of fire, immediately thinks of them as being of extraterrestrial origin, and then associates them with a landscape of ice and snow. This *could* account for his story.’
‘All right. But what would kick it off in the first place?’
Campbell shrugged. ‘Who knows? That’s the area he won’t discuss. As you could judge from the transcripts, there’s a point in his narrative beyond which he refuses to go. That point, obviously, is the actual incident that started the whole business, but he just doesn’t want to face up to it.’
Shifting uneasily in his seat, Epstein rubbed his eyes again, had a spasm of coughing, and felt despair as the taxi turned around Warren Street station, heading for Harley Street. The fantasy and the fact. The dream and the reality. He thought of the mysterious lights outside Galveston, of the enormous disk in the Caribbean, of the deaths and the disappearances and the contradictions in Air Force policy, and he realized that the dividing line was thin and could in truth be a mirage… And yet he had to know. His time was running out. He didn’t want to take his last breath before the truth was

revealed to him. Epstein felt a growing rage. He wanted to smash the walls down. He wanted to do it for Mary, for Irving Jacobs and for himself, for all the researchers who had suffered or passed away while the mystery remained. The taxi turned into Harley Street, stopped in front of Campbell's building. Epstein clambered out, leaving Campbell to pay the driver, and felt a rising impatience.
'Here we are,' Campbell said. 'The home of the brave.'
'How long before Richard's appointment?'
'Twenty minutes,' Campbell said. 'After you, sir.'
He opened the front door, ushered Epstein inside, then led him to the ancient elevator with its polished brass gate. Epstein felt trapped in the elevator, silently cursed its creaking lethargy, was relieved when they stepped out into the upstairs hallway and entered Campbell's suite. Campbell still had the same secretary. She had been with him for fifteen years. Though noticing how much she had aged, Epstein said gallantly, 'You haven't changed a bit, Elaine,' and shook her hand, then he followed Campbell into his office. After closing the door behind him, Campbell pointed to a chair facing the desk. Epstein nodded and gratefully sat down, breathing heavily, coughing.
'That's a bad cough,' Campbell said.
'Yes,' Epstein agreed.
'Did you eat on the plane?'
'Don't remind me,' Epstein said.
'Then a brandy won't do you much harm. Large or small?'
'Make it large.'
Campbell went behind his desk, opened a cupboard below it, pulled out a bottle of Rémy Martin and two empty glasses. He poured two stiff shots, slid a glass across to Epstein, then sat back and put his feet on the desk, his glass to his lips. Epstein had a sip of brandy, felt it burning down inside him, making his head feel light and bright, his eyes watering slightly. It did him some good, warmed him up, eased his feeling of unease, but it didn't stop the growth of his rage, his increasing frustration. He coughed again and cursed mildly, recall the hospital in New York; they had confirmed what he had sensed all along, but now the truth was tormenting him. One year, maybe two. The doctor telling him this had smiled when doing so. Epstein thought again of what he had learned and then tried to forget it.
'You had another session with Richard,' he said, 'since we talked on the

phone. Did you manage to crack him?'
'No,' Campbell said. 'The same routine, the same results. The minute you try to fill in the gaps, he stops giving answers.'
'You tried bullying him into it?'
'Yes. And he panicked. He just won't face up to the missing period, and I can't push too hard.'
'He's coming here twenty minutes from now?'
Campbell checked his wristwatch. 'Fifteen minutes. He's usually punctual.'
'I want to know,' Epstein said. 'I want you to give him the Pentothal. Believe me, James, it's very important to me… We must get him to talk.'
'It could be dangerous,' Campbell said. 'He's not just frightened – he's terrified. I'm not sure what will happen if we force him. The very thought makes me nervous.'
'Listen.' Epstein leaned forward in his chair, placed his glass on the desk, clasped his hands together and spoke urgently, with quiet, clipped precision. 'This is the most remarkable close encounter case that I've come across so far. It *could* be true, and if it is, it's important. Indeed, it's more than important – it's vital – so we have to succeed. I'm not trying to *invent* UFOs. I actually know they exist. I don't know what they are or where they come from, but I know they're for real. I've seen one myself. Stanford and I saw it together. It was in the Caribbean. It was enormous and bright and very clear, and it was visible a long time. That UFO abducted a scientist. Stanford and I were the last to see him. Now the CIA is breathing down our necks, and their breath doesn't smell nice. They don't believe our story – at least they *say* they don't believe it – but I have reason to think they might actually believe it, and that their concern is really due to the fact that we reported seeing that huge UFO in the Caribbean. Don't ask me any more for now. I'm begging you, just believe me. Now the CIA is hounding us, they're calling our story rubbish, and so, apart from natural curiosity, we have good cause to know. Richard might be what we need. He might unlock all the secrets. We have to take the chance – we have to crack him – because we have to find out.'
Campbell stared steadily at Epstein, his eyes bright and searching, then he let his feet fall to the floor and leaned over the desk.
'You've actually *seen* one?' he asked.
'Yes.'
'I can't believe that.'

‘I repeat: Stanford and I saw it together – and we didn’t imagine it. It was there a long time. There was an old boat beneath it. The UFO cast light and shadow on the boat. It was there. It existed.’
Campbell shook his head from side to side. ‘I can’t believe this,’ he said.
‘I’m not lying,’ Epstein said. ‘I don’t lie. You *know* I don’t lie.’
‘It’s too ridiculous,’ Campbell said. ‘And I don’tjust mean the UFOs. Richard’s whole story is like a dream – a typical dream.’
‘Typical? How?’
‘Because Richard was *seeing* it. He wasn’t involved in it; he was *observing* it. He was on the outside, looking in, observing his own dream. He’s not *active* in that narrative. He has no volition or will at all. All his actions are dictated by the other characters, and he never resists. He’s not really a participant. He’s merely an observer. At no point in the narrative does he display the slightest resistance to the men, or the creatures, he describes: what they will, he then does. It’s a denial of responsibility, a repudiation of his own will. It’s the classic dream of someone abdicating: the very heart of amnesia.’
‘And that’s all it is?’
‘Probably.’
‘Okay, let’s assume that it actually happened. Would his total lack of will, in such circumstances, be all that unusual?’
‘I don’t know what you mean.’
‘James, one of the most common aspects of contactee cases is the apparent lack of will, or resistance, on the part of the contactee. Contactees frequently talk of how, though terrified, they felt drawn toward the aliens, felt that they were *obeying* the aliens – even when the aliens appeared not to have actually spoken. Again, just as in Richard’s case, the common denominator seems to be a feeling of remoteness, of divorce from the self, with the contactees invariably behaving like zombies. Now, in this particular case we have the same thing. The woman, for instance, is initially terrified, but then, as soon as the beam of light strikes her, she becomes remarkably, unnaturally, calm. Likewise with Richard. The beam of light that strikes the woman misses Richard and therefore leaves him unaffected. However, when the alien raises his hand, or his metal claw, another beam of light strikes Richard and temporarily renders him unconscious – and this time, when Richard awakens, he still feels fear, but he’s also dazed and a bit removed, without much resistance. Thereafter, whenever Richard feels

frightened, the aliens simply wave a hand across his eyes and he immediately goes limp and feels remote again. Also, as with other contactees, Richard does what the men tell him to do, but believes that they're not actually speaking to him… Now is that so impossible?'
Campbell folded one hand over the other, his cheeks slightly flushed, his gaze sombre, his interest increasing.
'Are you suggesting a form of hypnotism?' he asked.
'Why not?' Epstein said. 'There's nothing extraordinary about that – and you know its effects. As you yourself have told me, once a person has been conditioned to accept the hypnotic state, a simple phrase or a gesture can be used to put him or her into a trance immediately. Thus, the alien, just has to pass his hand across Richard's eyes to make Richard go into an hypnotic trance – but still awake, his eyes open.'
'That's possible,' Campbell said. 'And you think the beam of light was some kind of hypnotizing device?'
'It could be,' Epstein said. 'There need be nothing especially magical about it. Bear in mind that light and sound can have remarkable mental *and* physical effects on normal people. For instance, a light flickering somewhere in the alpha-rhythm range, between eight and twelve cycles a second, can cause extremely violent reactions in the person exposed to it, including jerking limbs, faintness, lightness in the head, or unconsciousness. It is scientifically possible, therefore, that the beam of light described by Richard was some sort of laser beam that simply flickered on and off at the particular rate which affects the brain's basic rhythmic patterns and encourages hypnosis. As for the strange humming, or vibrating, sounds that also appear to affect the listener, it's a scientific fact that infrasounds, which are just below the limit of human hearing – hence Richard's uncertainty about whether he heard or *felt* the noise – can affect humans in the same way as flickering lights. Indeed, certain low frequency sounds can lead not only to a change in the brain's rhythmic patterns, but to actual *physical* changes, such as the breaking of glass or the killing of human beings by crushing their insides with pure vibration. Given this, I'm not being particularly farfetched when I suggest that the beam of light, combined with the vibrating sounds, could have led to the initial state of hypnosis.'
'Yes, Frederick, that's feasible.'
'Good. Now while we're still on the subject, there *is* one thing that

repeatedly crops up in contactee cases and could possibly tie in with all this. Time and time again we're told about how the so-called aliens pressed the contactee on the side of the neck – either by hand or with a metal device – and thereby rendered the contactee unconscious or temporarily without will. Could this be related to hypnotism?'
'My God, yes, it could… In fact, it's a standard form of hypnotism: the instantaneous technique, or the carotid procedure.'
'Which is?'
'Simple biology,' Campbell said. 'You merely apply pressure to a blood vessel near the ear, thus inhibiting the heart rate, interfering with the circulation of blood to the brain, and rendering the subject dazed and confused, susceptible to hypnotic suggestion.'
'And is there such a thing as *waking hypnosis*?'
'Yes. The subject is wide-awake, knows where he is and what he's doing, but is actually doing what he has been told to do by his hypnotist. Incidentally, on the opposite end of the scale – and this could certainly apply in Richard's case – the subject can be hypnotized when sleeping normally. You simply attract the attention of the sleeping subject with some sort of physical contact, hypnotize him by repeatedly telling him that he can hear your voice, have him perform what it is you require of him, then very gently put him back to sleep. He will later wake up, as per normal, and know nothing about it.'
'That could have happened to Richard when he awakened on the strange bed and found the man called Wilson standing over him.'
'Precisely.'
'And what about posthypnotic suggestion?'
'What about it?'
'I just thought it interesting that according to Richard's narrative he was told that he would remember nothing that had occurred – or at least that he might remember *some* of it, but that the little he recalled would be confused and probably not make much sense to him. That seems to be what's happened: Richard still can't remember it – it only comes back under hypnosis, but even there, it's pretty vague and disconnected… And there's still something missing.'
'Well, sticking to our hypothesis, yes, that's also quite possible. Assuming that Richard was hypnotized, any instructions to forget what had occurred would certainly make him forget.'

‘And there’s nothing particularly mysterious about this type of hypnosis?’
‘No. Quite routine.’ Campbell picked up his glass and had another sip of brandy, then licked his lips and set the glass down and folded his hands again. ‘You know, it *is* interesting,’ he said. ‘According to Richard, the man told him that he had a very strong will, great resistance, and that while most people forgot the experience, Richard himself might remember it – or at least parts of it.’
‘So?’
‘For a start, the remark confirms that the experience has been undergone by other people.’
‘Yes. Richard’s account certainly ties in with a lot of other such cases, most notably the Barney and Betty hill affair of 1961 and the Pascagoula case of 1973.’
‘A great similarity there, certainly. I remember both cases.’
‘That was for a start. What else is there?’
‘Well, dear boy, still leaning on our hypothesis, it’s to be noted that when the woman was hypnotized by the beam of light – assuming, of course, that she *was* hypnotized – she went into what appears to have been a trance, a wide-awake trance, and apparently experienced no more fear. On the other hand, when *Richard* was likewise affected by the beam of light, he became more remote, but did *not* in fact lose his fear. Now this could account for that strange man’s assessment of Richard: that he had very strong will and great resistance. Accepting this, it is then possible that the woman, even if hypnotized, might not remember what had happened to her; whereas a certain kind of person – a person like our Richard – would remember a certain amount under hypnosis. In short, while your so-called aliens can apparently make abductees forget their experiences, their success in this field is rather limited.’
‘And Richard?’
‘Even with Richard, had he not come for hypnosis, he would never have remembered it at all.’
‘Yet his dreams were a sort of recall.’
‘Right,’ Campbell said. ‘Another clue to his resistance. Richard remembered some of the events in his dreams, but didn’t know what they signified. It’s also worth noting that his dream – and it was the same dream every time – involves a group of men standing around him while he’s lying on a bed, or operating table. From what he’s told us, that can only be when

he was forced to lie down on the bed and they put the metal cap on his head – the experience he refuses to detail further.'
'Refuses to detail or simply can't remember.'
'Okay,' Campbell said, 'Let's assume that his captors actually existed and that everything we've discussed actually took place. The man called Wilson was obviously intrigued by Richard's unusual strength of will and told him that *he would have to come back*. Let us suppose, then, that the metal cap was a stereotaxic skullcap, that it was used to implant a minute electrode in Richard's skull to reinforce his inability to remember… Now, when one tries to force Richard to recall that particular episode in details, he not only displays considerable stress, but also clutches his head and shakes it with great violence – and later awakens with an extremely bad headache… Is it therefore possible that Richard has been *programmed* to feel pain and fear when he tries to recall that event? And, further, that they want him to return in order to check out the relative success or failure of the implantation?'
Epstein smiled with pleasure. 'You've just come full circle,' he said. 'Now *you're* the one asking questions. You've become a believer.'
Campbell grinned and raised his hands in mock surrender. 'I accept defeat,' he said. 'Now you have me as curious as yourself: another obsessed man.'
'Good,' Epstein said. 'I like to hear that. So, is it possible?'
'Yes,' Campbell said. 'Implantation of electrodes in the brain has been going on for years – overtly in animals, covertly in human beings, with the latter experiments mostly kept secret. What *we* do know at this point is that electrodes implanted in the human brain have been used successfully to activate both paralyzed and artificial limbs, to control otherwise uncontrollable muscular spasms, such as in Parkinson's Disease, to pacify violent mental patients and prisoners, and even to initial so-called *thought control* between a human controller and a computer. Now, given that any form of human brain manipulation can have frightening social and political possibilities – which is why, for instance, even the Society of Hypnotists is under constant government surveillance – a lot of the experiments on human beings have been conducted behind closed doors, most notoriously in mental institutions and state prisons. The results of such experiments are thus not widely known. Nevertheless, given what has already been accomplished, and what might have been accomplished in secret, it is safe to assume that the sort of programming we're talking about is well within the bounds of possibility.'

‘How are the subjects controlled?’
‘Well, it’s on the record that the reflexes and appetites of various animals have been controlled at a reasonable distance by a controller sitting behind a computer-linked console. These animals can be made to stand up, sit down, eat or starve themselves to death, play, fight, collapse in terror – just about anything. Regarding human beings, we have, to date, only been able to stimulate specific areas of the brain, and do so, reportedly, under immediately visual control. Regarding longdistance control, it’s reasonable to assume that the particular response required would be programmed at the time of the implantation – fed into the brain via the computer – and would be limited to one or two responses only. To put it at its simplest – and taking Richard as our hypothetical case – yes, they could have implanted an electrode in his brain and programmed him to feel pain and terror each time he attempted to think of a particular incident. In other words, it’s quite possible that when I try to force Richard to recall the skullcap incident, the very thought of it might stimulate the terror and the crippling headaches – a terror and pain caused by the implanted electrode.’
‘Another form of hypnosis,’ Epstein said.
‘No,’ Campbell said. ‘Total mind control.’
‘You mean that by taking this technology to its ultimate limits we could steal a man’s mind?’
‘That’s right,’ Campbell said.
Epstein stiffened in his chair, suddenly charged with excitement and energy, feeling that he was standing on the edge of a precipice, about to leap across to the unknown. The possibilities were boundless, the implications awesome, and the truth was probably locked in Richard’s mind. They had to pick the lock, had to force the door open. The risk would be great, but the rewards could be greater: the final unraveling of the mystery that now teased the whole world. Epstein shivered, feeling feverish, his head light and bright, no longer drained by fear and depression and thoughts of his grim future.
‘We have to!’ he exclaimed. ‘We have to use the Pentothal! We have to use it during this coming session and find out what happened!’
‘I’m not so sure,’ Campbell said.
‘*We have to*!’ Epstein insisted.
‘It might be too early for that. Too early. Too dangerous.’
‘Damn you, James, it’s important!’

‘It’s not *that* important, Frederick. I mean, you’ve been at this game for thirty years – you can wait a bit longer.’
‘I can’t,’ Epstein said, and felt ashamed as soon as he said it. ‘I have cancer. I have two years at the most. I won’t live beyond that.’
Campbell stared at him, shocked. Both of them: shocked. They stared at one another for a long time, the silence enslaving them. Then Epstein looked away, keeping his eyes on the floor. He suddenly felt very old, very frail, as if in finally acknowledging what was happening to him, he had made it real.
‘I have to know,’ he said eventually. ‘I can’t die without knowing. As you say, I’ve been at it for thirty years, but now I believe I can solve it. It’s the most important thing in my life. A lot of others have suffered for it. I can’t come this close and let go… and every day it’s more urgent. It’s not just for me. It’s not purely selfish. It’s for Irving and Mary and all the others who were ruined trying to crack it. There’s something going on, James. It’s not an illusion; it’s real. Now my time is running out and I’m close, very close, and I can’t sit back and hope that Richard remembers… I have to know *now*.’
Campbell sighed and stood up, turned away, stared out the window, turned back to face Epstein again, checked his wristwatch and frowned.
‘All right,’ he said. ‘I’ll give Richard Pentothal. After that, no matter what he tells us, I’ll have his head X-rayed.’
He sat down again. They stared silently at one another. The neat room was as quiet as a tomb and neither knew what to say. They both sat there, feeling stricken. They kept checking their wristwatches. They both sat there for a very long time, but Richard never showed up.

Chapter Twenty

When did Kammler and Nebe die? It was a long time ago. They were gassed as they slept in their rooms, and then I had them cremated. I didn’t really have a choice. My implants were not perfected. We were still using the Death’s Head SS and their obscene forms of discipline. It was shortly after the war. Kammler and Nebe showed much resentment. Powers corrupts and they both had great power and started plotting against me. I could not let this happen. My life’s work was reaching fruition. Hidden deep in the immense, frozen wilderness, the colony functioned. Thus I had to get rid of them. Their room doors locked automatically. They never knew all the

time they were there that the walls could spit gas. They died on their own beds. The room was aired and they were removed. They were taken to the crematorium in the base of the mountain, incinerated, turned to ash and smoke, leaving me independent.

How ironic was their death! It was a death befitting both. For how many had they themselves sent to the gas chambers during those nightmare years? I think particularly of Kammler. SS General Hans Kammler. Kammler planned the concentration camps, supervised the plans for Birkenau, was responsible for its four great gas chambers and its vile crematoria. A handsome, ruthless man. Energetic and decisive. His gross ambition, and his total lack of scruples, made him someone worth knowing.

August 1943. Hammler was then at his peak. His lust for power had increased every year and he was then almost godlike. Yet that wasn't enough for him. He wanted more and more. Most particularly, he wanted control of the V-2 rockets and all those who worked on them. He had tried for that and failed. Then Peenemünde was bombed. Himmler suggested to Hitler that Peenemünde had been betrayed, and that his SS should take control immediately. Hitler agreed to this. Himmler now had full control. He immediately moved mass production of the rockets to the caves near Nordhausen. General Kammler was put in charge. He became Himmler's right-hand man. When that happened, I had to do something to protect my own project.

Those were dangerous years. The war was not going well. The Russian offensive was a disaster, Italy had fallen to the Allies, Hitler's physical and mental health was collapsing, and the Reich was in ruins. My own position was no better. As it recall, it was precarious. I now doubted Himmler's sanity and will, and this made me uneasy. The slaves were still being sent to Kiel. From there they were shipped to the frozen wilderness. The great caves were expanding under the ice, but they seemed far away. I wondered if I would ever get there. I no longer trusted Himmler. As disaster followed disaster for the Reich, I saw his brimming hysteria. I still wanted the wilderness. I knew I couldn't depend on Himmler. His hysteria was making him indecisive and that meant he was dangerous. I still wanted the

wilderness, I didn't want Himmler there, and I met Kammler in 1943 and was drawn to his ruthlessness.

Kammler knew of my project. Himmler sent him to check it out. I was then at the BMW Platz near Prague, still working unceasingly. I knew the war would soon be lost. I was playing a double game. The game was highly dangerous, very tricky, and I had to be careful. I still badly needed Himmler. His facilities were essential. Yet I knew that he now lived in fear of being found out by Hitler. After all, it was betrayal. Himmler was building his private empire. If the Führer discovered his intentions he would have Himmler executed. Thus Himmler became frightened. In his mild eyes there was frenzy. He had promised to give der Führer great new weapons, and der Führer was restless. I didn't dare complete my saucer. Not until I reached the wilderness. I was frightened that Himmler's growing confusion might make him give it to Hitler. That would mean the end of everything. The Allies would take it over. As for myself, I would be classed as a war criminal, and probably hanged.

On top of this, there was Schriever. The Flugkapitän was ambitious. Yet another of Himmler's scientific pets, he had the need to impress him. Schriever's eyes devoured my saucer. He was in competition with me. I knew that if the saucer was completed, he would take all the credit. Already I had seen him do this. He had the slyness of a simple man. Himmler insisted that we share the whole project, and I knew what he meant. I was Himmler's secret. The Flugkapitän was not. Once the project was completed I would simply disappear, and then Himmler could offer der Führer my saucer as a German achievement. So, Schriever was a threat. He wanted credit for my achievements. Because of this, I withheld a great deal and understated my progress. Schriever worked from doctored drawings. I gave him enough to make it credible. The Schriever saucer could rise and hover briefly, but it didn't yet fly. I had to let it progress slowly. Not much, but enough. Meanwhile, in the BMW Platz, I quietly finished the real work.

My sole thought was for the wilderness. The hangars were multiplying beneath the snow. Sooner or later, I would have to escape and join the vast, hidden colony. I could not depend on Himmler. His rising panic had made him treacherous. I could see, in his fear and indecision, that he might never

leave. I needed another ally. Another man of gross ambition. I met Kammler in the BMW Platz and knew that here was my man.

Kammler was an organizer. He was decisive and ruthless. More importantly, his ambition was boundless, his selfishness total. I worked on him slowly. It took months, but I was patient. Kammler's one thought, at the time, was self-survival, and that's what I played on. He already knew of the secret colony. He was startled and intrigued. I could see, as I unveiled further facts, that he was drawn to the notion. The Reich was crumbling all about him. There were plots and counterplots. The Nazis were devouring their own kind and survival was difficult. Then, of course, there were the Allies. Kammler knew the war was lost. He also knew that if the Allies took him prisoner they would certainly hang him. Kammler had to get out of Germany. He had to disappear completely. When I knew this, I told him of my plan and he said he would join me.

That same month he went to see Himmler and blatantly lied to him. He painted me in a black light. He praised Schriever to the skies. He claimed that my project was a mess, that I was stealing from Schriever. I was too old, he said. Flugkapitän Schriever was young and bright. He said that Schriever should be given his own project and encouraged much more. Himmler wasn't too sure, but Kammler pressed home his point. He reminded Himmler that the Allied invasion had begun and that he should take precautions. Kummersdorft West should be evacuated. The American and Schriever should be separated. Kammler suggested that I be moved to the mountainous region of Thuringia, and that Schriever be moved to Mahren. It was better that way, he said. Schriever could then work unencumbered. Himmler, now dependent on Kammler, promptly gave his consent.

I was moved out shortly after. At last I was free of Schriever. In Kahla, in the mountains of Thuringia, I completed my major work. Himmler never knew about it. Kammler told him I was useless. Eventually, Himmler turned his attentions away from me and focused them all on young Schriever. That was just what we wanted. We were not concerned with Schriever. I had insured that Schriever's flying saucer project would never succeed.

June 25, 1944. In my office in the research center at Kahla, I talked to Kammler and Nebe. I remember it well. SS General Artur Nebe. A man whose very name suggested terror and the screams from the basements. General Nebe was ice and fire. He had the cunning of a rat. He was a man who did not show his feelings, who worked quietly and ruthlessly. An exemplary record with the Gestapo. Extermination squads in Russia. With such work he had gutted his soul and embraced the unthinkable. Nebe knew how to survive. He was a master of intrigue. He had trampled on the bones of countless comrades to protect his own skin. A dangerous man, certainly. Also, a cold realist. And that day in my office in Kahla his eyes were wide open.

General Nebe was escaping. There had been an assassination attempt. The Führer had survived the explosion and was now seeking vengeance. The reprisals were terrible. Himmler's men were butchering hundreds. A lot of officers were fleeing for their lives, disappearing forever. General Nebe was such a man. He had been forced to desert. Kammler had told him of what we were doing and he now wished to join us.

Nebe controlled the escape route. His most fanatical SS men joined him. Those men formed the chain that stretched from Kahla to the port in the Baltic. I often watched the trains pull out. The SS cracked their whips. The dogs snapped at the ankles of the children as they wept on the platform. Many came from the concentration camps. Others came from the Lebensborn. We stole children from all over Europe and marked them for slavery. The trains took them to Kiel. The ships and submarines transported them farther. They vanished off the face of the Earth and were not seen again.

Meanwhile, I continued working. My time was running out. The final components for the saucer were in production, but had not yet been tested. The Red Army was in Warsaw. Very soon it would reach the Oder. I had to complete the saucer and test it before the Russians arrived.

Kammler helped me all he could. His authority was considerable. What we didn't have, he took from other scientists and less powerful research centers. Hitler was dreaming of secret weapons. He spared no expense in getting them. All over Germany, even as the bombs were falling, the

scientists worked night and day. There was an Atomic Bomb project. There were electrical submarines. There were laser beams and infrared warheads and remote-control systems. The Kaiser Wilhelm Institut. The Forschungsinstitut of Lindau am Bodensee. From such places I stole what might help to enhance my own project. The swirling energy of the Feuerball. A porous metal called Luftschwamm. In the laboratories of the Kreiselgerate, not far from Berlin Britz, I solved the problems of gyroscopic control and Prandtl's infamous boundary layer. This latter proved to be the breakthrough. The boundary layer was the key. By the end of 1944 we had conquered it and started final construction.

The thought of Schriever amuses me. Perhaps it always will. I look out upon the gleaming ice caps and think of what that man lost. Schriever lived for fool's gold. His saucer designs were all useless. While I finished the real work in Thuringia, he chased phantoms in Mahren. His flying disk was an abortion. All my guidelines had been false. Nevertheless, Schriever they would work, and that's what I wanted. Himmler rarely asked about me. He kept visiting Schriever. The Schriever disk could hover just above the ground, but could do little else. No matter: it was impressive. Schriever thought he could make improvements. He told Himmler that it only needed time and the Reichsführer believed him. That was just what I wanted. It was exactly what I had planned. As Himmler focused all his attention on Schriever's disk, I got on with the real one.

It was a miracle that I managed it. It was a desperate, frantic race. The skies overhead were filled with Allied aircraft, the horizon was smokey. The Ardennes offensive had failed. The Soviets had now crossed the Oder. The Allied armies were advancing in the south and our towns were in ruins. Hitler had moved into the Chancellery. He was preparing his Götterdämmerung. His Reichsführer, Heinrich Himmler, was in panic and had almost forgotten me. Himmler wanted a flying saucer. He wanted Schriever's flying disk. Because of this, I was free to continue without interference. The war raged far away. The smoke thickened on the horizon. We stepped out of our caves to see this, and then we went back to work.

I remember it all vividly. The sounds of labor still reverberate. The great underground complex at Kahla represented my future. The caves were

inside the mountain. From the air they were invisible. Inside them were thousands of slave workers and dedicated technicians. The bright lights stung our eyes. Walls of stone cast eerie shadows. Machines roared and plates of silvery porous metal dangled over our heads. The flying saucer was a skeleton, but it soon grew to fill the hangar. The technicians clambered under its steel ribs, their eyes covered in goggles. The searing white flames of the welders. The laborers sweating under the Perspex dome of the pilot's cabin. The lights beamed down and flashed off the cabin and hazed the slave workers. The great caves dwarfed them all. They were cathedrals carved from stone. The sounds of riveting and welding and drilling reverberated throughout. The men looked very small. They were like ants in an ant-hill. They climbed ladders, crossed catwalks, stood on platforms and girders, now removed from the real world, isolated inside the mountain, working long hours and sleeping little, supervised by Nebe's soldiers.

We kept working night and day. We heard the thunder of distant guns. Every night our trains snaked down the mountain and headed for Kiel. The flying saucer took shape. Its gleaming mass filled the hangar. The final plates were welded around the pilot's cabin and the body was finished. The large saucer hung from chains. It was lowered onto the sturdy legs. The legs housed the four jet propulsion boosters that would aid its ascent. The disk locked onto the legs. The noise echoed throughout the caves. The slaves looked on in silence, their eyes dulled with exhaustion, while the technicians all cheered and applauded, their hands linked in triumph.

As historic day. I will never forget it. I stood beside Kammler and Nebe and felt as if I was dreaming. The enormous hangar doors opened. Light and cold air rushed in. The Kugelblitz, now supported on metal blocks, had its own kind of beauty. We wheeled it out of the hangar. The date was 14 February, 1945. The sun shone upon the base of the mountain, but was darkened by gray smoke. Then the rain and snow came. We had to cancel the test flight. Two days later, on 16 February, the piloted saucer soared to the heavens. It climbed vertically and gracefully, stopped abruptly and then shot south. It became a winking light above the battlefields, a bright star in the smokey haze.

The next week, we destroyed it.

Chapter Twenty-One

The minute he saw the house the pain left, but the fear lingered on. Richard stood by the gate. The gravel path ran through the gardens. The moonlight fell over the flowers, over the Audi car in the driveway, over the Italian tiles that led up to the front door of the elegant Georgian house. Richard pressed his head again. He couldn't believe that the pain had gone. The pain had pulled him from his bed, the voices whispering, urging, and sent him on the next train to Cornwall, determined to find her. Now he shivered with trepidation. The pain had gone, but the fear lingered on. He glanced up at the house in the moonlight and wondered how he had found it. In truth, it had not been easy. She had told him she was from St Nicholas. It was a very small village, he had discovered when he arrived here, and those he had spoken to knew the lady.

He had asked about her in the local pub, feeling dazed, the headache blinding him, and the men with the pints of beer and whiskies had all chattered at once. Aye, lad, they knew the lady, knew the expensive foreign car; the lady and her bloody great car were located just outside the village… And so he had walked here, still dazed, the headache killing him, and now stood by the wide, open iron gates, not believing he'd made it. The headache had gone, but the fear lingered on. Richard kicked the gravel nervously with one foot, then looked up at the large house.

What had he come? He didn't know why he had come. Yes, he knew – because the headaches had defeated him and the voices had urged him. What voices? *The voices*. The voices? Was he mad? Sitting slumped in the train, his head throbbing, he had sensed his own lunacy. Not voices. Couldn't be. He had gone to the bar carriage. The bar was crowded and the smoke stung his eyes and made his throbbing head worse. And the voices. *I won't listen*! He drank a double Scotch. It burned down inside him, a thin flame, and made him feel better. Yet the headache grew worse. Forced back to his seat, he sat slumped again. Closing his eyes, he tried to block out the voices, but they refused to be silenced. What voices? *I won't listen*! He wanted to scream with pain. The pain was killing him and the voices were

whispering and making him dizzy. Five hours on the train. Shadows creeping across the hills. He had glanced once at the moors and closed his eyes and felt the fear breathing over him. What voices? *I won't listen*! The train had pulled into Bodmin. He had disembarked and walked to the village like a man in a trance. Then the smokey pub, the noisy chatter and ringing glasses. He had asked about the lady with the Audi car and they had pointed the way. A short walk through the darkness. The night silent, stars glittering. He had arrived at the gate of the house… and then the headache had gone.

The fear lingered on. It was with him right now. He stood by the open gates and kicked the gravel and saw lights in the windows. The house looked white in the moonlight. It was a converted, eighteenth century manor: elegant, romantic, dreamlike, the stars glittering above it. Richard advanced through the gateway, stopped again and felt the fear. Why fear? There was nothing to fear, and yet he felt it, and shivered. Then he moved forward again, knowing he couldn't turn back now. When he thought of turning back, his head hurt and the voices returned. He was imagining it, of course. He tried to turn back and his head hurt again and the voices returned. Licking his lips, he studied the house and then moved forward again.

Silence. A light breeze. The light breeze hissed through the silence. Richard walked along the broad, curving driveway toward the white Audi. It was definitely the same car. There could be no doubt about it. Richard looked at the car and felt a chill and remembered the white haze. No, he should not have come here. Yes, he had to go on. The voices whispering in his head confirmed the latter as he approached the car. He stopped, glanced above him, saw the black sky, the stars, felt fear and something else, a sense of wonder, then moved forward again.

He stopped at the car. His fear and wonder had increased. He shivered, felt the ice in the breeze, and reached out to the car. His ran his fingers along the hood. He had to confirm that it was real. Satisfied, he gazed up at the house, the tall windows in white walls. All the lights were on. The whole house was ablaze. He saw velvet drapes, a chandelier, a rich mahogany table. There were lanterns about the front door, a door made of polished

wood. The door was open and he thought that was strange and it made him more frightened.

Fear. The inexplicable. He moved slowly around the car. The breeze hissed and chilled the sweat on his brow and made him shiver again. He advanced across the Italian tiles. The fear closed in and held him. He had the urge to turn around and run away, but he just couldn't do it. Then he was on the porch. Italian tiles and potted plants. There were vines writhing along the balustrades then gleamed white in the moonlight. He stood there, uncertain, thinking of Jenny and the doctors; remembered them, forgot them, heard the voices, then walked up to the front door.

Why was the door open? He knew why: she was waiting for him. She had known he would come, somehow known that, and now she expected him.

Fear. The inexplicable. The need to know and the fear of knowing. He reached out and touched the door with his fingertips, lightly stroking it, testing it. The door was real enough. A bright light poured out from inside. He stepped forward and pushed the door farther back and then stepped into the house.

Silence. The hall was empty. Paintings hung from paneled walls. There was a chandelier glittering below the ceiling, illuminating the stairs. Rich carpets, shining glassware. Richard stood there, couched in fear. The stairs ran up to a balcony that was angled around the hall, closed doors concealing numerous other rooms and offering only more silence.

Richard licked his dry lips and looked reluctantly around him. Two varnished doors, one at either side, leading into more rooms. One of the doors was open. Light poured out around it. He knew it was the room that he had seen from the driveway: the room with the velvet drapes and chandelier and rich mahogany table. He took a deep breath, not alone, sensing someone, remembering the silhouettes in the white haze, the woman's red hair and green eyes. Then he walked to the open door. The silence swam out to surround him. He pushed the door back and stepped in and then stopped, feeling even more frightened.

She was sitting at the far end of the table, her red hair tumbling down, the green eyes very bright, even now, at this considerable distance. She was staring directly at him, perfectly still, almost frozen. She was wearing a black evening gown, flowery frills around the sleeves, and her right hand was holding a glass of what looked like red wine. Though a chandelier was hanging above her head, the table was further illuminated with flickering candles.

Yes, Richard was frightened. Her green eyes were insane. She raised her glass and sipped at the wine and then set the glass down.
'I was expecting you,' she said.
'Why?' Richard asked.
'I just knew you were coming,' she said. 'Don't ask me how. I just knew.'
Richard didn't move toward her. He was frightened and confused. He didn't know why he was here, couldn't believe that he was here, felt unreal and divorced from himself, not in charge of his actions. The woman just sat there, staring at him, not smiling. In the black dress, surrounded by flickering candles and antiques, she looked like someone from long ago. Another time, another age. Richard hardly knew where he was. He had the feeling that he had stepped into a dream from which he might not escape. His headache had gone, but the fear lingered on. He stood there, near the door, staring at her, wondering who had informed her.
'How did you know?' he said.
'I told you not to ask that.'
'I had to come,' he said. 'I just had to. I have to know why.'
She smiled bleakly and raised her glass, sipped more wine, set the glass down. The glass made a sharp ringing sound that made Richard's heart leap.
'Why did you have to come?'
'I'm not sure,' Richard said. 'I'd forgotten – I was trying to forget
– and then it all rushed back to me. I started having bad headaches. I thought the headaches were going to kill me. I heard voices, or I thought I heard voices, and kept thinking of you. I just had to come. It seemed imperative that I come. I had the feeling, I had this thing in my head, that said to come here would cure me. The headaches were really bad. They drove me out of my apartment. I didn't know what to do, I couldn't think of anything else, just… the train… I thought of catching the train, and that made it seem better.'

‘And your headache has gone?’
‘I think so. I hope so.’
‘How strange,’ she said. ‘My headache’s gone as well. It’s very strange… I’m not frightened.’
Her declaration frightened Richard. He glanced nervously around the room. He didn’t know what he was expecting to see, but he had to look anyway. A long wall lined with books. Velvet curtains, framed paintings, various trophies, the glint of bottles and glasses. The long table was illuminated. Her green eyes were slightly shadowed. The shadows deepened where they swallowed the corners, creating eerie, gargoyle shapes. Richard shivered, feeling cold, wondering vaguely where he actually was. He glanced around him and then stared at the woman, feeling desperate, in need of her.
‘How are you?’ he asked.
‘Pardon?’
‘How are you?’
She looked bemused, brow furrowed, not believing what she had heard, then she put her head back, the hair gleaming, burning red, tumbling over her bare, convulsed shoulders as her laughter exploded.
‘What…?’
‘Oh, my God!’ Her laughter reverberated around the room, a shocking sound, possibly insane, devoid of humor or warmth. ‘Oh, my God, what a question!’
Richard froze where he stood. ‘Shut up,’ he said quietly.
‘*How are you*?’ the woman gasped, getting her breath back. ‘What a question to ask me!’ Then she burst out laughing again. Hysterical laughter. Richard stepped forward, hardly knowing what he was doing, seeing bright light, deep shadows, glinting glass, flickering candles, the chairs stacked against the table, all empty, there for ghosts, her laughter whiplashing the silence, demented, a jagged sound. He slapped her face. It was a single, precise blow. The laughter ceased as her head jerked to the side, and froze there, green eyes wide. She took a deep breath. She stared at the opposite wall, her eyes unnaturally bright, her lips forming a tight line, holding in a cold fury. Richard stepped back, pulled a chair out and sat in it. The woman stared at the wall, leaning forward, turned sideways, then she straightened up and took a deep breath and touched her cheek with her left hand.
‘You hurt me,’ she said.
‘I’m sorry,’ Richard said. ‘I didn’t know what else to do. You sounded

hysterical.'
She touched her cheek again, smiled ruefully, picked her glass up, sipped some wine and then put the glass down and pushed the bottle toward him.
'Have a drink,' she said. 'I think you need a drink. Before the night's out, you'll need it more, but you probably won't get it.'
'What does that mean?' Richard asked.
'I don't know,' she replied. 'I don't know what any of this means… I only know that it's happening.'
Richard poured himself a drink, noticed that his hand was shaking, quickly set the bottle back on the table and returned his gaze to the woman.
'How did you know I was coming here?'
'I just knew,' the woman replied. 'I just had the feeling… a very strong feeling.'
'You left the front door open.'
'Yes, I left it open.'
'You don't leave a front door open for a mere feeling. It must have been more than that.'
The woman just smiled. Her green eyes were strange. They were bright, but they were looking straight at him as if not really seeing him. Richard felt himself shivering. He reached out for his glass of wine. He picked it up and turned it around and saw the candlelight reflected in it, forming a blood-streaked, yellow eye.
'Drink it,' the woman said. 'It's not poisoned. It won't hurt you, I promise.'
Richard drank some wine. He set the glass back on the table. The woman watched him with that strange, bright intensity, her left hand tightly clenched.
'Where's your husband?' Richard asked.
'He's not here right now.'
'Where is he?'
'I don't know,' the woman said. 'He left me five months ago.' 'Left you? You mean for good?'
'Yes, I mean for good. The poor man thought his wife was going mad, so he packed up and left.'
'So *are* you going mad?'
'Possibly. I think so.' She picked her glass up and drank some more wine, then licked the rim with a pink tongue. 'I rarely sleep these days,' she said. 'I get nightmares when I *do* sleep. I get angry, start smashing things up,

wreck the place, rip the phones out.' She set her glass back on the table, lit a cigaret, inhaled, turned her head aside to exhale the smoke, slowly turned back to face him. 'We had dreadful rows,' she said. 'I never knew what I was saying. I just hated him – no reason – just hated him and wanted to get rid of him. I had to be on my own. I don't know why – I just had to. I wanted to be alone in this mausoleum, where I could wait… wait for something… Naturally, he left me. I could barely live with myself. I had headaches, like migraines, bad dreams, really terrible, then he left me and it all went away and I sat back and waited. I've been waiting for five months.' She exhaled cigaret smoke, let it swirl around her face, a blue haze disguising her fading good looks, the lines of tension and loss. Yes, she had changed. Her face advertised the fear. Richard now saw a woman much older, quietly mad, disappearing.

'Waiting?' he asked. 'Waiting for what?'

She shrugged, shook her head, studied her glowing cigaret, looked at him as if looking through him, nicked ash to the floor.

'Fucked if I know,' she said. 'I just know there's something happening. Last night I had a headache, went to sleep and dreamed about you. I woke up and thought my head was coming apart, but I kept thinking of you. I knew then that you were coming. I was convinced that when you came I'd be cured, so I opened the front door.'

'That's crazy,' Richard said.

'Is it? You really think so? And yet *you* had a headache, it drove you out of your apartment, it compelled you to catch a train to Cornwall, it drove you all the way here… Are we both…? Are we crazy?'

Richard glanced around the room. A nineteenth-century drawing room. The shadows swallowed the corners, crept along the bookshelves, crawled across the floor and faded out against a bright pool of light. Another time, another age. Another age, another place. He sipped his wine and felt the shifting of his mind, slipping away through a black hole. He wasn't here; he was there – somewhere else, far away – here and there, which were one and the same, divorced from reality. Then he stared at the woman. Her green eyes swam in the shadows: mad eyes, obsessed with what was coming, seeing more than they understood.

'What happened?' Richard asked. 'That day on the moors. I remember the silhouettes in the white haze. Only that. Nothing else.'

The woman licked her upper lip, unfocused eyes wandering, returning,

fixing upon him, looking through him and beyond him, going back, finding nothing.
‘Why ask me?’ she said. ‘I remember no more than you. I woke up three days later, in the car, in the same place, and drove straight home, not understanding what had happened, not really believing it. I remembered the start of it. That huge aircraft in the haze. I remembered the saucers flying around us, the lights beaming in on us. Then nothing. Oblivion. I woke up and you weren’t there. It was dawn and I thought I’d slept there all night, that I’d somehow passed out. So, I drove back here, went to bed and slept all day. I got up, had some food, watched TV, and found out that three days had passed. Then the headaches started. The nightmares, the fear. When my husband asked me where I had been, I told him to fuck off. Later, when he tried to make love to me, I flinched with revulsion. I couldn’t understand it. I just knew I had to get rid of him. I had fits and started wrecking the house, and he left me eventually. It was easier after that: no more nightmares, no headaches. Just people… I couldn’t stand to see people, so I stayed in the house. I just hung around all day. I drank a lot and that helped me. I knew something was happening, *would* happen, but I didn’t know what. No nightmares, no fear. That all started again last night. I knew then that it had happened, that it hadn’t been a dream, and I knew that you would come here tonight and that soon it would end.’
‘*What* would end?’ Richard asked.
‘I don’t know. I just know it will end.’
She stubbed her cigaret out, picked her glass up, drank some wine, set the glass back on the table, looked at it, then smacked it away. The noise made Richard twitch. He glanced at the table. The glass was lying on its side, reflecting the candlelight, still rocking slightly from side to side, the red wine pouring out across the table and dripping down to the floor. Richard looked at the woman. She stood up and smoothed her dress. She was tall and slim, her face pale and fatigued, still elegant, her hair gleaming in the light, falling onto her shoulders.
‘Did the police come?’ Richard asked.
‘The police?’ She looked puzzled. ‘No, not the police… Some men came, wearing black suits. Briefcases… From the government… Took notes.’
‘About a week after it happened?’
‘No. About a month. They said it was just routine. They took notes. I haven’t seen them since then.’

‘They came *a month* after the event?’
‘That’s right. A good month.’
‘What did you tell them?’
‘I told them what I remembered about the incident. I don’t think they believed me.’
Her gaze was steady, but unfocused. She was still standing in front of her chair. The shadows fell across her face, across the swell of her breasts. Richard stared at her, mesmerized. She moved slightly and the light from the chandelier fell upon her hands. Her fingers were locked loosely together, long and thin, a pale web.
‘What did they say?’ Richard whispered.
The woman shrugged. ‘Nothing much. They told me they had seen you, that you’d told them what had happened, that they just wanted to confirm that it was true. I told them what I remembered. It wasn’t much, but they wrote it down. Two men, quietly spoken, polite. I haven’t seen them since then.’
‘You confirmed that it really happened?’
‘I confirmed what I remembered. When I got to the beam of light, they just smiled, not believing a word of it. They said I had seen the planet Venus. They got in their car and drove off and have not been back since.’
She still stood there, gazing around her, far away, not really present, a ghostly lady in a long, flowing dress, the walls behind her in shadow. Richard couldn’t grasp what was happening. His fear blossomed in the silence. He looked up and saw her glittering eyes, their bright, unfocused depths. What was he doing here? What were they both waiting for? Richard thought of standing up and walking out, but his head tightened instantly. He knew then that he wouldn’t leave. His gaze fastened on the woman’s breasts. He breathed deeply and the threatened pain faded and his head felt more normal.
‘This is crazy,’ he said.
‘Yes,’ she said, ‘it’s crazy.’
‘I’m frightened, but I don’t really know why.’
‘It’s all right. It’s all right.’
Richard felt a sudden chill, remembering the dazzling white haze, remembering that what she’d said at that moment had frightened him more. *It’s all right*. *It’s all right*. He recalled the words clearly. He now looked at her green eyes, too bright, surveying the room, and he knew, even through his mounting fear, that in some way he needed her.

‘We’ve been brought together,’ he said.
‘Yes,’ she said, ‘I think so.’
‘Why?’ he said. ‘I don’t understand.’
‘It’s all right. It’s all right.’
She gently bit her lower lip, staring past him, through the windows, looking up at the black, star-flecked sky, her eyes searching, appealing. A shiver ran down Richard’s spine, made him feel more defenceless. He saw the darkness lying over the lawns outside, a fine line of mushrooming trees. The stars were bright and multitudinous, offering silence, revealing nothing, and he returned his gaze to the woman and felt the fear deepening.
‘I feel tired,’ he said obliquely.
‘It’s very tired,’ she replied.
‘Do I stay here? Is that what I do? I *have* to stay here… the headaches.’
The woman just smiled, a strange smile, not her own. She raised her right hand and stroked her red hair, flecks of steel in her green eyes.
‘Yes,’ she said, ‘the headaches… Something’s happening… It’s all right… Yes, of course, you have to stay here… We both have to stay here.’
Richard was mesmerized. Her black dress flowed on her body. She was tall, her skin white, very elegant, spectral in the shadowed light.
‘Can I sleep here?’ Richard asked.
‘Yes,’ she said. ‘You should sleep. You’ll feel better.’
They stared at one another. The wind moaned across the lawns. The candles flickered on the table, their light defeated by the light from the chandelier, a larger pool of light around them both: a pool of light in the darkness.
‘I’ll take you up,’ the woman said.
‘Thanks,’ Richard said. ‘I haven’t actually brought anything with me… No pyjamas… No towels.’
The woman waved her right hand, a languid, eloquent gesture. ‘Don’t worry,’ she said. ‘It’s all right. I’m always ready for guests.’
Richard stood up awkwardly, his body aching and weak, glanced up and was blinded by the chandelier, looked away, his eyes sparkling. The corners of the room were dark. Glasses glittered in a cabinet. He saw his shadowy reflection in the glass, a wavering ghost, nonexistent. Then he saw another reflection, a flowing form, incorporeal, felt a chill and turned around and saw the woman advancing slowly upon him.
‘This way,’ she said, touching him lightly as she passed, her long fingers outspread, brushing briefly across his chest, then falling back to her side as

she walked on, the dress rustling around her.
Richard followed her out, stepping into the hallway, a pulse beating nervously in his stomach as he walked toward the stairs. The hall seemed very large. It looked bigger than it was. They advanced across the carpet, the woman's dress rustling lightly, then the woman put her hand on the bannister and calmly walked up.
Richard followed her, feeling strange, more unnerved by her calmness, confused, not really knowing what was happening, wondering if he was still sane. None of this seemed real – not the house, not the stairs, not the lights that bled weakly from the walls and fell over the woman. He reached out for the bannister. It was smooth to his touch. He looked up at the woman, at the swaying of her hips, his gaze traveling along her bare arm to her wrist, the white flesh on the polished wood. She was real. It was happening. They both stepped onto the landing. The woman looked back over her shoulder and smiled enigmatically… then she walked away from him.
Richard followed her, feeling cold, along the balcony, through the shadows, the wall-lamps hanging downward, glowing dimly, a modest aid in the gloom. The woman stopped at a closed door, put her hand out, turned the knob, gently pushed the door open and then stepped back, waving Richard inside. He glanced at her, saw the smile, a strange smile, not her own, then he shivered and brushed past her and stepped in, his should grazed by her breasts.
'Will this do?' she asked quietly.
Richard hardly saw the room, just the bed, the covers turned back, a lamp burning on a table beside the bed, a pool of light in the shadows.
'Yes,' he said. 'It's fine.'
'You look tired,' she said. 'Exhausted. That other door leads to the bathroom. In there you'll find towels… pyjamas.'
Richard nodded, but said nothing, too nervous, confused, mesmerized by her eyes, by that green, opaque glittering, by the long line of her body, the black dress, the shadowed light all around her.
'Don't worry,' she murmured. 'It's all right. It's all right. Have a good sleep and then you'll feel better. We'll just stay here. We'll wait.'
He wanted to know what she meant, what she thought they were waiting for. He opened his mouth and then closed it again, now afraid of his own voice. The woman stepped forward, put her hand on the doorknob, stepped back and pulled the door as she went, disappeared, the door closing.

Richard stood there in the silence, in a noise that seemed like silence, his ears ringing, the closed door in his eyes, feeling tense and light-headed. He stood there a long time. He heard her walking away. She stopped walking, a door opened and closed, and then the silence was total.

Richard sighed, feeling dazed, still frightened, then turned around to have a good look at the room, a spacious room, neat and comfortable. He studied it carefully, drank it in and saw nothing, just the bed and the lamp on the table in a window-framed darkness. He crossed the room to the window. Feeling nervous, he looked out. He saw the far edge of a patio, a low wall, a few steps, a flat lawn disappearing in the darkness, some trees, a small garden shed. He looked up at the sky. The moon glided beneath the stars. He shivered and turned away, feeling desolate, then went into the bathroom. He turned the light on. Blue and green tiles, blue rugs. A toilet, a marble bath and a shower, expensive and tasteful. He turned the light off. He didn't feel like a bath or shower. He crossed over to the bed and stood there, then went back to the bathroom. He turned the light on. It was bright and stung his eyes. He used the toilet and then took his clothes off and stepped under the shower.

He turned the water on to hot, let it scald him and revive him, remained there for a very long time, then turned it off, dried himself. He walked out of the bathroom, closing the door behind him; naked, he went to the bed and lay down, sighing forlornly. He lay there for some time, hearing the silence of the house. He heard the wind blowing outside the window, then he turned out the bedside lamp.

The darkness was divided. Moonlight fell in through the window. Richard heard the moaning wind, felt the pounding of his heart, looking up, looking around, seeing the ceiling, the looming walls, his fears multiplying and joining and becoming a blanket. He suddenly felt claustrophobic, rubbed his face with his hands, saw the moonlight trickling over a cupboard and a wicker chair. He lay there, breathing deeply, forcing himself to stay calm. He wanted to get off the bed and leave the room, but he just couldn't do it. What was happening? *Why stay*? He rubbed his face and closed his eyes. He saw the moonlight – or imagined he saw the moonlight – and then it seemed like a dream.

The door clicked as it opened. Richard opened his eyes. He looked around – or imagined he looked around – and saw her shadowy outline. She was standing in the doorway, silhouetted in yellow light. She was naked beneath

her nightgown, a short nightgown, transparent, and he saw her slim waist, her broad hips, her long legs parted slightly. She didn't say a word, just stood there, breathing evenly. Richard rubbed his face and then licked his lips and blinked a few times. The woman closed the door and padded toward him and lay down beside him.

Flesh. The warmth of skin. There were dreams within the dream: the moonlight falling on the white sheets, on the edge of a pillow, on a flash of red hair, the gleaming eyes, the pink tongue on the wet lips. They came together and merged, their limbs colliding, embracing, warm skin, willing flesh, her flattened breasts, his sweating spine, searching fingers, scratching fingernails, outspread thighs, thrusting groin, a dream within a dream, shadows writhing in the moonlight, rising up and coming down and rolling over and biting like animals… He had to have her, couldn't stop, either dreaming or awake, not caring, not knowing, seeking release from his fear, a child again, helpless, lips and tongue on the nipple, wanting solace, revenge, forgiveness, final answers, his hands searching for her breasts, his belly sliding on her belly, thrusting up, trying to hide himself inside her, sweat and blood, life's reality… Was it really happening? Did it matter? The red hair across his eyes. Her lips sliding down his chest, down his stomach, soft and moist, opening wide to receive him… Release. No more fear. He looked up and saw the moonlight. He closed his eyes and let himself be devoured, flowing out, pouring into her.

The moonlight. The darkness. Stars swimming in the void. He lay back and dissolved and disappeared and defied space and time. To touch and be touched. The beating blood and pounding heart. To touch and to feel and to know and to drift toward peace. He remembered her touch. He awakened, still remembering. He blinked and rubbed his eyes and looked around him, his body still burning.

'It's all right. It's all right…'

Richard saw her in the doorway, her back turned toward him, naked beneath the white transparent gown, slipping out of the room. Then she was gone. He felt her warmth on his skin. He blinked again and looked hard at the door and saw the light on the balcony. Then the fear returned. He sat up straight on the bed. The moonlight fell into the room, met the light from the doorway, illuminating the necklace she had dropped before entering his bed.

The fear slithered in slyly, crept over him, enveloped him, turned to ice that

first froze and then burned to leave him sweaty and shaking. He glanced wildly around the room. The moonlight fell in through the window. He felt the fear and it forced him from the bed and made him rush to the door.
He saw the woman on the stairs, walking down toward the hallway, still naked beneath the white transparent gown, her lean body outlined. Richard watched her, terrified. She moved as if in a trance. The short nightgown rippled over her breasts, on her thighs, as she padded down on long legs. Richard took hold of the bannister, seeing pale light on her face. He shouted at her – someone shouting; someone urging her to come back – but she continued on her way down the stairs, her gaze fixed on the front door.
Richard glanced over the balcony. The lights in the hall were dim. The front door was open, moonlight falling on the hall, a small figure silhouetted on the porch outside, featureless, not moving.
The fear grabbed Richard and crushed him, made him step back from the bannister, pressing his spine to the wall and glancing around him, paralyzed, his head spinning. Then he suddenly moved again. He felt a need to touch the woman. She was real, a vibrant presence, flesh and blood, and she was all that he had. Richard hurried toward the stairs. He saw the woman in the hallway. The figure standing on the porch had disappeared, but the moonlight still poured in. Richard cried out again. The woman didn't respond. Richard hurried down the stairs, his heart pounding, as she walked out the door.
Richard froze again. He held the bannister with one hand. He looked down at the door, at the moonlight, the fear slicing through him. Then he moved again, scarcely knowing that he was doing so, his sole thought for the woman, for her presence, for that touch of reality. He reached the bottom of the stairs. Moonlight fell across the floor. He stepped forward and saw the woman on the lawn, the darkness swimming around her.
Richard walked to the door. The fear was choking him, draining him. He reached the door and stepped out onto the porch and saw the woman ahead of him. She was in the middle of the lawn. She stopped walking and just stood there. The wind blew around her, pressed the nightgown to her body, her hips and her legs emphasized in singular beauty. Then she slowly turned around. She was looking directly at him. He saw her pale face, her red hair, and her strange, haunting smile.
Richard stood on the porch, felt the wind and its ice. He was draining out of himself, the fear destroying him, dulling his senses. The woman stood there

on the lawn. Her red hair blew in the wind. He heard the wind and then he heard the humming sound, *felt* the sound, was crushed by it. He stepped forward slowly, keeping his eyes on the woman. He saw the line of trees behind her, the light appearing beyond the trees, a hazy light that rose and spread out to become a pulsating fan.

'Oh, my God,' Richard whispered.

After that, he said nothing. There was nothing to say. He knew that it had ended, that it was over, and that he could not turn back. No turning: the fear. No resisting: the pain. Richard shook his head and licked his dry lips and stepped onto the lawn.

The woman was waiting for him, her arms hanging down by her sides. He stopped when he was halfway toward her, searched in vain for her green eyes. A trick of light and shadow. Richard blinked and looked again. He saw the smile on her face, that ghastly grimace, but her eyes were missing. Richard shook his head and shivered. He stared hard at the waiting woman. He stepped forward and saw that her eyes were closed, that she was standing there dreaming.

Richard almost stopped breathing. He felt the pounding of his heart. He walked over to the woman and touched her, but her eyes didn't open. Then the fear really shook him. He stared wildly at the sky. He saw the moon gliding under the stars, a few dark, drifting clouds. Richard looked past the woman. He saw the light above the trees. The light pulsated and formed a hazy fan, a spectral glow in the dark night.

Richard started to weep. The tears rolled down his cheeks. He heard the sound, *felt* the sound, was crushed by it, and he clenched both his fists. Then he saw them coming toward him. They were faceless in the darkness. There were three of them, all of them small, spreading out, walking slowly. Richard stared at them. The fear slithered down his spine. He forgot the woman by his side, forgot Jenny and the doctors, thought of nothing but the dread that was embodied in the men coming toward him. The tears rolled down his cheeks. He saw his history dissolving. He watched the men spreading out, coming toward him, and he knew he must join them. His grief and fear combined. His head tightened and throbbed. The men advanced out of the darkness, the light fanning out behind them, their shadows shifting and falling before them, creeping over the damp grass. Richard stood still. The men approached him and stopped. They were small and they wore silvery masks and were encased in gray coveralls. Richard

stood there, transfixed. One of the men walked up to him. The man reached up and touched Richard's neck and the fear fell away from him.
'Yes!' Richard said.

Chapter Twenty-Two

New York in December was a bitch of a city, the wind blowing like ice along the canyons of concrete, stabbing at Stanford's eyes and raw face, his Californian blood frozen. He cursed and turned his collar up, saw the bright lights of Broadway, breathed the dust and the exhaust fumes of the traffic, appalled by the clamour. He wasn't in a good mood, hadn't been for a long time; he now lived with a cold, suppressed rage that often threatened to choke him.

'New York,' he murmured. 'Shitsville.'

He didn't know what was happening to him, was lost in his obsessions, haunted by the lights of Galveston, by the girl on the porch, by what he had witnessed in the Caribbean, by the mysteries that increased every day and made sleep more difficult.

Stanford felt the freezing wind. He cursed again and walked faster. The traffic ran along Broadway, lights flashing, horns honking, the sidewalks crowded with junkies and prostitutes and pimps, passengers tumbling out of cabs, out of restaurants and theaters, the neon signs winking brilliantly in the night, a kaleidoscopic display. Stanford studied it with distaste. He had never liked New York. He cursed again and then turned into a disco-bar, hurrying down the steep steps.

The bar was in a basement, beyond a silver-gleaming arch, past the blond girl who sat behind a desk and cash register. The girl was wearing a negligible halter, her breasts ballooning dramatically, her tanned belly exposed, her crotch emphasized by hot pants, long legs in black stockings crossed languidly. Green lipstick. False eyelashes. Stanford paid her and went in, passing a man in black leather, the amplified rock music exploding over him, almost deafening him, strobe lights flashing on and off the small stage where a rock group was screaming.

‘Are you alone?’ someone asked him.
‘What’s that?’ Stanford said. He looked around to see a shock of purple hair, rainbow eyes, the girl a cross between an Apache Indian and a Buddhist monk, her lips lined with glitter dust and pouting invitingly, blowing smoke in his face.

‘Thirty bucks,’ she said. ‘Make it fifty for all night. We go to my place and I’ll show you some tricks that you’ll never forget.’
Stanford silently moved on, pushing his way through the crowd, brushing against creamy breasts and jolting asses in hot pants, the air smelling of nicotine and marijuana and sweat, the strobe lights flashing on and off the heads that bobbed up and down frantically. Stanford just kept going, concentrating on the bar. He saw phosphorescent shirts and tight denims and sunglasses, the girls elegant and tatty, displaying tits and belly buttons, the men rattling with necklaces and bracelets, their talk loud and pretentious. Scaduto wasn’t at the bar. Stanford moved on, looking elsewhere. He cut across the dance floor, the band shrieking above him, the dancers gyrating on all sides, asses jolting like pistons. He ducked waving hands and whipping long hair and finally reached the far side. A line of girls held the wall up, looking sexy or limp, and he avoided their eyes and went past them, entering another, marginally quieter room.
The band sounded more distant here, the sound muffled, the talk clearer, customers crushed between a parallel line of booths that led back to a second bar. He saw Scaduto at the bar, unmistakable, flamboyant dressed, wearing a fringed buckskin jacket, very tight purple pants, knee-length boots, a mess of chains around his neck, hanging over the counter. Approaching him from behind, Stanford, grinning, grabbed a fistful of his long blond hair.
‘What the fuck – ?’ Scaduto yelped.
‘Hi, hotshot,’ Stanford said. ‘Why the hell did you decide to meet me here? I can hardly hear myself speak.’
Swivelling around on his bar stool, Scaduto grinned crazily and slapped Stanford’s shoulder, making the latter release his hair. ‘You old shitface!’ Scaduto exclaimed, patting his disheveled hair down. ‘How you been? Good to see you.’
‘So what are you doing here?’ Stanford said, glancing around him. ‘You’re getting a bit old for this, aren’t you? I mean, these girls… they’re all kids.

Jailbait.'
Scaduto rolled his eyes and grinned again, formed his right hand into a fist, pumped it up and down above his groin and groaned loudly, theatrically.
'That's the idea,' he said. 'A guy doesn't get any younger. At forty you're almost put out to grass, and these kids soothe the pain. I like 'em tight, Stanford. God, yes, I like 'em tight! Some day I'm gonna find one so tight, they'll have to cut my dick off.'
'You want a drink?' Stanford asked.
'I've already got one, old pal.'
'Have another,' Scaduto said. 'I'm only in town for one night. Let's have an old-fashioned reunion. We'll throw us a big one.'
Scaduto slapped the counter with one hand. 'Goddammit!' he exclaimed. What a pleasant surprise. It's been a long time, old buddy.'
'What do you want?' Stanford asked.
'A bourbon on the rocks will do for now. A chaser to follow my beer. Fuck it, the night's just begun; let's have us a good time.'
There was only one barman, moving fast but overworked, serving two or three groups at a time, his head down, his brow furrowed. Stanford tried to attract his attention, failed, tried again, started wondering if the barman was ignoring him or if the noise had just deafened him. Scaduto came to his rescue, getting off his stool to bend over the counter, his long hair falling around his face. 'Hey, greaser!' he bawled. 'What the fuck? Are you jerking off back there?' The barman glanced at him, face swarthy above a bow tie, glared hard and then recognized Scaduto and broke out in a grin. 'Does it feel good?' Scaduto bawled. 'You got blisters on your fingers? Two bourbons on the rocks, you fucking greaser, or I won't pay the check.' The barman grinned and shook his head, poured the drinks, disappeared, and Scaduto grinned at Stanford and laughed as if he just couldn't stop.
'Here's to you,' Stanford said.
'Fucking A,' Scaduto responded. He drank some bourbon and wiped his lips with the back of his free hand, his glassy gaze slipping sideways. 'Just look at it,' he said. 'All that tight cunt, all that honey. I swear, the young aren't what they used to be – they just can't get enough of it.'
'You're kidding yourself,' Stanford said. 'You're just a middleaged *roué*. You can't stand the thought of being forty and now you're making an ass of yourself. It's called the male menopause.'
Scaduto leered as he glanced around him, almost falling off his stool, then

he reached out and grabbed Stanford's shoulder and grinned like a lunatic. 'Damned right,' he said. 'I stand unzipped and corrected. I'm a middle-aged prick, a wilting cock, and I'm having a great time. So how are you, Stanford? What have you been up to lately? How long's it been? Five years? Ten years? I hear you're still working with that guy, Epstein.'
'That's right,' Stanford said. 'I'm still with Professor Epstein. You and I, we last met in '69, as I recall, when you finally left the NICAP.'
Scaduto's stomach was flopping over his broad, glittering belt and his gaudy, flowered shirt was too tight. He was not ageing gracefully.
'Great days,' he said, grinning. 'I had a damned good time. Wandering over the whole country, meeting folk, seeing places, chasing UFOs like they were going out of fashion – a great time, a fond memory.' Clearly drunk already, he almost fell off his stool, but steadied himself and then stared curiously at Stanford's shoulder bag. 'Hey, what you got there, pal?'
'It's just an overnight bag,' Stanford replied.
'Oh, yeah? Carrying anything of interest? Anything I can swallow or smoke or inject? I mean, anything, old buddy, to let my fire and help me through the long night?'
'No,' Stanford said.
'Not to worry,' Scaduto said. He closed one eye and waved a finger across his face, a stage Irishman, far gone. 'We can only go back to my place. I've a few syringes there. A wee nip, a little jab and then it's Heaven, a sublime glide through inner space. You fancy that, old buddy? We might even get some snatch. Something warm and as tight as a glove, to make the dawn look more pleasant.'
'Who knows?' Stanford said.
They ordered more drinks. The cigaret smoke was dense. The room was packed and becoming noisier, people tugging and pushing, colored lights gliding over the walls in surreal, dreamy patterns. Scaduto drank too fast. He kept ordering more drinks. He was obsessed with the girls, their long legs and plunging necklines, his glassy eyes darting restlessly around the place, his wolfish leer unappealing. Stanford was quietly shocked by him, found it hard to recognize him, was embarrassed to see this forty-year-old man in his juvenile clothes. In truth, he was ridiculous, pathetically trying to fool himself, and Stanford couldn't reconcile the man before him with the one he had known. Scaduto had been with the NICAP for close to twelve years, had investigated UFOs up and down the whole country and built up

an admirable reputation. He had left in 1969. He had been in Arizona then. He and Stanford had gone drinking, had painted Tucson red, and had then gone their separate ways without keeping in touch. That's why Stanford was shocked: he couldn't recognize the old Scaduto. The man swaying on the bar stool, talking loudly, leering openly, was a pathetic shadow of his former self, obsessed with drugs and jailbait.

'I'm still at it,' Stanford told him. 'I'm still out there chasing UFOs. I've probably been at it too long. Why did *you* give it up?'

'I thought, fuck it,' Scaduto said. 'That's all: I just thought, fuck it. There was too much coming down, too much flak, and I just didn't need it.'

'What sort of flak?'

'Just flak,' Scaduto said. 'Flak from the left, right and center, day in and day out. A real drag, believe me.'

'I've bought a bottle,' Stanford said. 'Here, fill your glass up… I don't understand. What kind of flak? Who was giving you flak?'

Scaduto swayed from side to side, almost fell off his stool again, but held onto the counter, cursing, and picked up his glass.

'Everyone,' he said. 'Fucking flak from all sides. Who needs the CIA, the FBI, the fucking Air Force? I couldn't take it anymore. Too much shit on my desk. When they started coming to see me at midnight, I decided to quit.'

'Midnight?' Stanford said.

'Would you believe it?' Scaduto said.

'Who came to see you at midnight? I don't understand that.'

Scaduto glanced at the girl beside him, had a drink, smoothed long hair, gazed down at the bar and started snorting like a horse at the starting post.

'Fucking CIA,' he said. 'Those bastards came to see me. Came at midnight, got me out of my bed, my cock still standing straight. No rough stuff. Just questions. A formality. A mere formality. Sat me naked in a chair, froze my balls and talked quietly, politely, like we're having a business lunch. Very pleasant. Civilized. Didn't mind if I poured a drink. Said, it's your house, you do what you want, we're just here for a talk. Asked me some questions. About my work at the NICAP. Said they'd heard from a friend of a friend that I was digging too deep. Then we had a serious chat. Woke me up. Interesting. They said they hoped I wasn't feeling too tired, but could they make some suggestions. Suggest, I say, I'm breathless. They suggest I clip my wings. They say I shouldn't be mixed up with UFOs, that they don't

really like that. I say it's a free country. They agree that it is. They also say they saw some drugs in my bathroom and they're highly illegal. I tell them it's a setup. I say you're setting me up. They tell me that's a nasty thing to say and that I could get ten years. You want me to leave? I say. You want me to leave the NICAP? We wouldn't dream of suggesting such a thing, they say, but now that you mention it… You can do what you want, they say. It's a free country, pal. I can work any place that takes my fancy. It's just that they're worried about those drugs that they found in my bathroom. I say I'm sorry about that. I say I'm truly repentant. They say maybe it's the strain of chasing UFOs that's making you take them. You have a point there, I say. I say I'm gonna resign from the NICAP. They say that's a wise decision, we respect you for that, and maybe, if you really leave the NICAP, we'll forget what we found here. That's real decent, I say. I confirm that I'm resigning. They both shake my hand, very pleasant, and walk out the door. So, I resign from the NICAP. I get a job with RCA. I forget that I ever knew the NICAP – and those guys never come back. Hallelujah. Peace, brother.'
Staduto burped and glanced around him, smiled beatifically, eyes blinking, then he picked up his glass and stared at it, surprised.
'Fuck,' he said, 'it's empty.'
'Here,' Stanford said, picking up the bottle. 'Have another. It's on me. So what were they worried about?'
He topped up Scaduto's glass, watched him put it to his lips; Scaduto burped and put his glass down, his red eyes slipping sideways.
'Motherfuckers,' he said.
'What bothered them?' Stanford asked.
'Secrets,' Scaduto said, slurring the word. '*Secrets*! I knew things I shouldn't have known. Those sonsofbitches, they knew I'd been to Canada – and they didn't like that.'
'Canada?'
'Right,' Scaduto said. 'Very cold in the forests, very quiet, and at night the winds haunted you.'
'I don't understand,' Stanford said. 'What's Canada got to do with it? They accused you of digging too deep. What did they mean by that?'
Scaduto, more drunk than ever, grabbed Stanford by the arm, leaned closer to him, breathing into his face, and whispered melodramatically, 'So what have you really got in that shoulder bag?'
'Nothing,' Stanford said. 'Some spare clothes, pyjamas, various papers, a

calculator, odds and ends… I told you: it's just an overnight bag.'
'You're going somewhere?' Scaduto asked.
'I just got here,' Stanford said.
'Of course, Stupid of me. Forgot. So what you really got there?'
'Nothing,' Stanford repeated.
'Jesus Christ,' Scaduto said. 'A little smoke, a little coke, a little something to shoot up with? What the hell, we can't go on like this all night – I'll take just about anything.'
'I didn't bring anything,' Stanford said. 'I'm only here for one night. Here, have another drink. We'll find something else later.'
'Shit, yes, let's do that.'
Stanford filled Scaduto's glass and received a nod of appreciation. Scaduto drank deeply, shook his head to clear it, then looked around him again.
'Sonsofbitches,' he said. 'Those sonsofbitches made me leave. I was having a good time at that time, but those bastards just killed it.'
'Why?' Stanford asked.
'My discoveries,' Scaduto said. 'Very cold up in Canada, the forests, all that shit in the woods.'
'What shit?' Stanford asked.
'The fucking truth,' Scaduto said. 'I found out and I braced them with the facts and so they paid me that visit.'
'You took the facts to the CIA?'
'Whistled in like the breeze. You bastards know all about it, I said. You bastards knew all along.'
'Knew what?'
'They kicked me out. Took my papers and kicked me out. They said don't come around again, you're fucking crazy, these are lies, then they paid me that cute midnight visit and made me leave the NICAP. No more research for me.'
'What research?' Stanford asked.
'Hey, listen,' Scaduto said, grabbing Stanford by the arm, leaning closer and hissing into his face, his red eyes darting left and right. 'Let's go back to my place. To hell with these women; they'll only give us the pox. Let's get high the clean way. I've some really hot shit back there; blow your fucking head off. Okay, buddy? Let's go!'
He tried standing, but tripped over the lower leg of his bar stool, crashing into Stanford's shoulder and spinning off and bumping into some other

drinkers. Stanford reached out and grabbed him, held him upright, shook his lightly, and he straightened his shoulders and looked around him, outraged by the angry stares. ‘Stupid cunts,’ he said. ‘Standing there right in front of me.’ Then he grinned and threw an arm around Stanford. ‘Let’s go, old buddy, let’s get out of here, let’s blow our minds through the roof.’ They made their way back across the packed dance floor, the lone line of lonely ladies, the screaming rock band on the small stage. Scaduto waved to some friends, shouted greetings, his good teeth gleaming, still clinging onto Stanford, unsteady, his face a jigsaw of colors. It took a while to reach the stairs, the crowd thicker than before, the pert buttocks and bulging breasts teasing as they struggled for release. Eventually they made it, stepping under the silvery arch and going up the stairs, Stanford still supporting Scaduto as they stepped back onto the busy sidewalk.

‘Jesus Christ,’ Scaduto said. ‘All the lights! They’re fucking blinding me. Jesus, I just love it here on Broadway. I love the Big Apple.’

‘Where do you live?’ Stanford asked.

‘In SoHo,’ Scaduto said. ‘I’ve got a little loft in Broom Street. We’ll be there in no time.’

He started off along the sidewalk, swaying dangerously from side to side, and Stanford stuck close beside him, not wanting to lose him. The neon signs flickering crazily, the car drivers honked their horns, and the sidewalks were crowded, people queuing for the theaters, the whores waiting impatiently in the side streets in their come-hither outfits, hopeful clients silhouetted in the bright lights of the stores’ plate-glass windows. Stanford ignored it all, now obsessed with cracking Scaduto, just wanting to get him back to his loft, sober him up, get him talking some sense.

‘These hookers,’ Scaduto said. ‘They sure as hell turn me on. Just look at that little bitch wearing candy floss – I mean, she’s practically naked. What about it, Stanford? You think we should take one back with us? We’ll take that Amazon and share her between us, shoot some stuff, have a threesome.’

‘I’d rather not,’ Stanford said. ‘I don’t like to pay for it. Let’s go back to the loft and shoot up and then I’ll make a few phone calls.’

‘That’s my Stanford,’ Scaduto said. ‘Always in there with the phone book. The most famous phone book in Lover’s Lane and it’s always paid dividends. You had a reputation, Stanford. I’ll have to hand you that. When it came to getting pussy, you could do it, no two ways about it.’

They turned into Broome Street, still close together, passing art galleries

and antique shops, health food stores and fresh food restaurants, the old warehouses converted, repainted, decorated, the fire escapes saluting the past, the bedlam falling behind them.
'Those sonsofbitches,' Scaduto mumbled. 'Those CIA bastards. I'm now earning twice as much as I did before, but it's just not the same.'
'A raw deal,' Stanford said.
'Damned right, a raw deal. Now I'm a rep' for RCA and that's why I'm fucked up.'
'What worried them?' Stanford said.
'What I found out.'
'What did you find out?' Stanford asked.
'Fucking Canada. My *God*!
Scaduto stopped at a converted warehouse, almost fell against the wall, straightened up and plunged his hands in his pockets and eventually withdrew a door key. He had trouble finding the keyhole, kept cursing and mumbling, eventually managed to get the door open and stagger inside. Stanford followed him in, opened the gates of the elevator, a large elevator once used for heavy goods, now used only by residents. Scaduto swayed as they went up, holding languidly to the gate, tried to open it when the elevator stopped, then had to let Stanford do it. The door opposite was large and ugly, the paint stripped off it, paint flaking, but the left behind the door was luxurious, a plush *Playboy*-styled penthouse.
'Wow!' Stanford explained. 'Is this yours?'
'Shit,' Scaduto said, 'I feel sick. I gotta fix myself up.'
He burped and slapped his belly, shook his head to clear it, then made his way along the clean, waxed floorboards of the spacious, rectangular loft. The walls and ceiling were painted white, stretching away to a wall-length window, the living area located near the window, illuminated by spotlights. Stanford stuck close to Scaduto, ready to prevent him from collapsing; they passed a large, framed Andy Warhol reproduction that covered the right-hand wall, its colors bleached out on their approach to the big window where in daytime the light poured in. Scaduto stumbled and almost fell, but somehow managed not to do so, straightening up and skirting around a modern couch to stop beneath an arched Flors lamp.
'Christ,' he said, 'I feel shitty. I think my head's stuck up my ass. The room's spinning, the walls are closing in. What the hell are we doing here?'
'I want to talk to you,' Stanford said.

‘You want to shoot up first?’ Scaduto took his jacket off and threw it carelessly on the couch and started rolling up the sleeve of his left arm.
‘Those fucking sonsofbitches killed. They put the fear of God into me. Very nice. Polite. Perfect gentlemen. Planted cocaine in my bathroom.’
‘I thought you took that anyway.’
‘I didn’t have it at the time. I was clean as a whistle, the bathroom was bare, and those bastards had me set for ten years because I hit them with Canada.’
‘I want to talk to you about that.’
‘No way, Stanford, I’m not talking. That bathroom’s note bare anymore and I want to shoot up.’
‘I’m not joining you,’ Stanford said.
‘Then have a drink,’ Scaduto said. ‘Relax. Put your feet up. Watch TV. We’ll call some broads and have us a good time.’
‘I have to know,’ Stanford said.
‘Fuck you, baby, I’m not talking. It never happened. I can’t remember. I know nothing. I won’t talk. It’s not worth it.’
Scaduto finished rolling his sleeve up, slapped and pinched his bared arm, licked his lips and then staggered to the door that led to the bathroom. Watching him disappearing, Stanford felt desperate and outraged, wondering what he could say to this lunatic, his former friend, to shake him out of his stupor. The loft had central heating. Stanford felt uncomfortably warm. He also felt explosive with frustration and had the urge to smash something. It couldn’t happen again: he couldn’t let this one go. He stood there and let the rage take him and shake him awake. Then he cursed and turned around, hurried across the rush matting, hesitated, clenched his fists tight, then entered the bathroom.
Sky-blue walls. Mirrored panels. The bath unit was charcoal brown. Scaduto stood there with one foot on the bath, his knee supporting his elbow. He was tying a tourniquet to his arm. He had one end between his teeth. His fist was clenched and a vein throbbed in his neck, beads of sweat on his forehead. Stanford glanced at the sink. He saw the gleaming syringe. Scaduto grunted and tugged at the tourniquet and then looked up at Stanford.
‘I have to know,’ Stanford said.
The tourniquet slipped from Scaduto’s teeth. ‘What the fuck are you talking about?’ he said. ‘Can’t you see what I’m doing here?’
‘I have a contact,’ Stanford said. ‘A strong CIA contact. He said that you’d

found something out that could blow this whole thing.'
'Fuck off out of here, Stanford. Sonofabitch, that's why you came. I must be fucking dumb. I should have known. Now just get the hell out of here.'
'I have to know,' Stanford repeated.
'I know nothing,' Scaduto said. 'If I knew, I'd have blown it to the media and made myself rich.'
'You're frightened,' Stanford said.
'Go to hell. Get out of here. I don't know what the hell you're talking about. Fuck off, Stanford. Just leave me.'
'Tell me.'
'I want to shoot up. Jesus Christ, I can't think straight. I've got my head up my ass, my nerves are singing, and you're starting to kill me. I don't know anything, Stanford. I don't remember, I don't care. I'm going to shoot up and you're not going to stop me and that's all there is to it.'
Stanford moved in fast, his left hand swinging sideways, sweeping Scaduto's bent leg off the bath and making his foot slam to the floor. Scaduto jerked forward, following the line of his leg, and Stanford moved in and grabbed him by his long hair and jerked his head back. Scaduto yelped and jerked back up, his head shaking, mouth agape, hands flapping, trying to cover his belly when he saw Stanford's punch. A sluggish gesture, too late: Stanford punched him in the belly. Scaduto doubled up and Stanford grabbed him by the hair and threw him into the wall. Scaduto gasped and seemed to dance, hands waving, legs akimbo, then he groaned, turned around, his hands reaching for the sink, then leaned over the sink and vomited, his body shaking in spasms.
Stanford stood there, feeling cold, far removed from himself. He waited until Scaduto had turned around, and then he hit him again. It was another punch to the stomach, one blow, sharp and brutal, and Scaduto grunted with shock, doubled over, reached out, grabbed Stanford and slid down his legs and then collapsed to the floor.
Kneeling above Scaduto, Stanford rolled him onto his back, grabbed him under the armpits and pulled him up as he mumbled and moaned. He dragged Scaduto to the shower, inched in backward, laid him down, pushed him into a fetal position and then turned the shower on. Scaduto yelped and wriggled wildly, shocked back to his senses, the water drenching his clothes, forming a pool around him, as he groaned and kicked his legs and waved his arms, a fish flung on the shore. Stanford kept changing the

temperature, first hot, then icy cold, and Scaduto opened his eyes and bawled a stream of obscene abuse and slithered around like a drowning rat. He got up on his hands and knees, shaking his head, dripping water, cursed again and tried to crawl from the shower and was pushed back by Stanford. Scaduto howled and waved his hands. He managed to get up on his knees. He was gasping as he swayed from side to side, the water hissing down over him. Stanford turned the shower. Scaduto groaned and flopped forward. Stanford grabbed him and dragged him over the sky-blue tiles, past the bath, through the doorway. Scaduto kicked and waved in protest, sluggish movements, devoid of strength, while Stanford dragged him across the living area, then left him on the floor beneath the couch and stood there and just stared at him.

Scaduto was shivering. He shook his head and groaned and cursed. His fingers scrabbled at squares of rush matting, the steam still rising off him. Stanford stood there, saying nothing, breathing deeply, fists clenched, feeling cold and removed from himself, but now determined to finish it. Eventually Scaduto moved, pushing himself with his hands, shaking his head and struggling up on his hands and knees, a colt learning to walk. He coughed to clear his throat, took a deep breath, turned sideways, then hauled himself on to the couch and slumped there, looking stunned. Stanford walked across the loft. He had left his shoulder bag on a table. He picked the bag up and unzipped it and pulled out a small taperecorder. He set the tape-recorder on the table, letting the bag fall to the floor. Scaduto watched him, his glassy eyes wary, still red and unfocused. Then Stanford went back to him, knelt down in front of him, reached out and grabbed him by the shoulder and shook him a little.

‘You’re going to talk to me,’ Stanford said. ‘You’re going to tell me all you know. We’re going to stay here all night, you’re going to talk and keep talking, and we’ll go over it again and again until I’ve got what I need. You don’t have to be formal about it. Just lay it on me as it comes. I’m putting it all on tape, I’m going to cross-check and edit, and when I’ve finished it should be in sequence and sound reasonably intelligent. I’m not bullshitting, Scaduto. I want to drain your brain. I want everything, from your first day to your last, and I want no evasions. If you’re a good boy I’ll reward you: I’ll let you shoot up. If you’re a bad boy, I’ll beat the shit out of you and then start again. And don’t try lying, Scaduto. Don’t leave anything out. If you lie, or if you leave anything out, I’ll go straight to the CIA. I’ll

show them what you've given me. That should be enough to excite them. They'll be around here so fast, you won't know your balls from your ass. So don't mess with me, Scaduto. Talk long and talk well. If you give me what I need, if it's believable, I'll never mention my source. I'm turning the tape-recorder on now. I'm going to sit right here beside you. Just relax, put your feet up and talk, and the night will soon pass.'
Stanford went back to the table, picked the tape-recorder up, bent down and picked up his shoulder bag and then returned to the couch. He sat down beside Scaduto. He reached into the shoulder bag. He withdrew a lot of cassette tapes and set them down on the arm of the couch, where they formed a neat pile. Scaduto stared at all the tapes. He licked his lips and shivered slightly. Stanford picked up the first tape, slipped it into the tape-recorder, turned the machine on and then sat down, looking right at Scaduto.
'That's it,' he said. 'Talk.'

Chapter Twenty-Three

'My phone's been bugged,' Epstein said quietly. 'That's why we're out walking.'

It was night time in Washington, DC, and they were strolling through the busy streets of Georgetown, passing discos and restaurants, hopefully anonymous in the crowd. The town looked like a Christmas card in its blanket of snow.

'Bugged?' Stanford said. 'You've been *bugged*? Why the hell would they do that?'
Epstein turned his collar up. He looked older and extremely frail. He coughed a lot and rubbed his eyes constantly, rarely raising his head.
'I'm not sure,' he said. 'It must have been done when I was away. I think it has something to do with young Richard Watson.'
'No one knew about that.'
'My passport,' Epstein said. 'It makes me nervous. They must have us under surveillance. I think it may have started in the Caribbean.'
'Mr Gerhardt.'
'That's right. They're disturbed about how much we witnessed. I'd like to

know why.'
'Damned CIA.'
'Yes,' Epstein said.
'Where we go, people disappear. It's not a comforting thought.'
They were in Wisconsin Avenue, passing kids wearing baubles, the outdoor vendors bravely hawking their wares despite the freezing cold. Stanford saw little around him, now buried inside his head, obsessed by the girl in Galveston, by his experience in the Caribbean, by the revelations of Gardner and O'Hara, by Scaduto's minutely detailed story. Stanford couldn't leave it now: he was a fish hooked through the throat. No matter what might befall him in the future, he now had to continue.
'You said Scaduto was sensational,' Epstein said. 'All right, let me hear it.'
'I need my notes.'
'No, you don't. You have that famous photographic memory, handed down from your family. All gifted. All with photographic memories. So you don't need your notes.'
This was true enough. Stanford still had fond memories of his childhood in San Jose, California, the family breakfasts over the long pine table, his mother and brother and two sisters competing noisily with the facts and figures that the five of them all held in their photographic memories. It was a family inheritance, his mother had informed him. Her own mother and her brothers and sisters had all possessed the same gift. And it was that gift, the gift of instant, accurate recall, that had helped Stanford to be a brilliant researcher. So, no, he didn't need his notes. He remembered Scaduto's every word, down to the very last, minute detail.
'I don't know where to start,' he said. 'The whole story's just incredible – and it's pretty damned complex.' He glanced briefly around him, his vision dazzled by the neon lights, hearing the disco music pounding out from crimson-lit, basement doorway. 'Okay,' he continued. 'The basic background to Scaduto is that he was working for the National Investigations Committee on Aerial Phenomena way back in 1957, when it first started up.'
'The NICAP,' Epstein said. 'A civilian organization. Not too strong a background at all. The outside looking in.'
'They're an efficient organization,' Stanford said, 'and damned well you know it.'
Epstein smiled, huddled up against the cold, almost lost in his thick, fur-

lined coat, the street lights washing over him.
‘So,’ Stanford said. ‘I trust I can now continue… You know, of course, about the Levelland sightings.’
‘Naturally,’ Epstein said. ‘The most remarkable sightings on record so far. November 2, 1957. Seven different automobile drivers, all at different locations around Levelland, Texas, suffered at approximately the same time inexplicable automobile disablement and subsequent recovery after coming across large, egg-shaped, glowing metallic objects that were sitting on the roads before ascending vertically and disappearing. The Air Force later caused themselves acute embarrassment by (a) not examining the reported landing sites; and (b) attributing the cause of the sightings to an electrical storm that was not in fact in the area of Levelland at the time.’
‘Full marks,’ Stanford said. ‘So, the Levelland sightings formed a sort of grand climax to the biggest UFO flap since 1952. Those sightings did indeed cause the Air Force a lot of embarrassment – and led to the NICAP pushing for congressional hearings. In August, 1958, John McCormack’s House Sub-Committee on Atmospheric Phenomena requested a week-long hearing in closed, secret session, but the NICAP’s pleasure in this was quickly squashed. Any hope that the hearing would be a fair one was destroyed by the evidence of Captain George Gregory, then representing Project Blue Book, who came out with so many half-truths, he made Donald Menzel seem almost Christlike. Given this, as you can imagine, the House Sub-Committee decided to take no further interest in the matter.’
‘So?’
‘So the members of the NICAP were furious. And they were even more furious when, in December of that year, the Air Force published a staff study that came down heavily on the civilian UFO groups, accusing them of being biased and sensationalist. To make matters worse, it was during the same month that the NICAP learned, through one of the more influential members of the NICAP board, that the Robertson Panel, in making their recommendations back in 1953, had, when discussing civilian UFO groups then in existence, used the chilling phrase: “The apparent irresponsibility and the possible use of such groups for subversive purposes should be kept in mind.” And, further, when they discovered that both the FBI and the CIA had been keeping extensive records on people involved in UFO investigations, including quite a few members of the NICAP.’
Epstein nodded wearily, rubbed his eyes and coughed again, looking away

in embarrassment when an elegant prostitute started coming toward him. Skipping around her, Epstein and Stanford kept walking, both aware that the prostitute had turned around and was following them, though keeping her distance, possibly still hopeful of some trade.

'Now,' Stanford said, 'stories about the CIA's involvement in the UFO phenomenon had been circulating for years, but a lot of people put it down to paranoia. However, after Gregory's performance in front of the Sub-Committee, and after learning about the Robertson Panel recommendations, some of the members of the NICAP, including Scaduto, decided to check out the situation. Then, just after they began their investigations, one of the members of their board came up with a pretty amazing story.'

The prostitute kept trailing them, swinging her shoulder bag, looking prosperous in her long coat and boots, as Stanford noticed when he glanced back over his shoulder. Seeing her, Stanford thought of the girl in Galveston, experienced a sudden, shocking lust, and then waved his hand from left to right, indicating 'No.' Glancing back over his shoulder again, he saw the woman shrugging and turning away, prepared to look for trade elsewhere. A neon light flashed green and red, and the snow drifted lazily along the sidewalk as Epstein stared at his own feet.

'Apparently,' Stanford continued, 'just a few weeks earlier – this was 1959 – the Office of Naval Intelligence had heard of a woman in Maine who claimed to be in regular contact with extraterrestrials and brought this fact to the CIA's attention. Since this seemed like a typical crank contactee case in which the woman, a psychic, had used automatic handwriting for communication with the extraterrestrials, the CIA naturally gave it a miss. However, the Canadian government had also heard about the woman and they sent their leading UFOlogist to interview her. According to the Canadian expert, the woman, during a trance, had correctly answered highly complex questions about space flight. Surprisingly, when the US Navy learned about this, they sent *two* intelligence officers to investigate. During the subsequent interview, one of the Navy intelligence officers, who had been trained in ESP, tried to tune in to the woman's contactee; this experiment failed, so he and his associate returned to DC and informed the CIA. This time the CIA showed more interest than before and arranged for the ESP-trained intelligence officer to try making contact in CIA headquarters. Six witnesses – two of them CIA employees and one of them from the Office of Naval Intelligence – get together in the office in

Washington to observe the results of the experiment – and this time, when the intelligence officer went into his trance, he reportedly made contact with *someone*.'

Stanford glanced at Epstein, trying to gauge his reaction, but his friend was gazing down at the snow-covered ground, looking frail even in his heavy coat.

'At that point,' Stanford continued, 'one of the men in the room demanded some kind of proof that they were in contact with extraterrestrials. The intelligence officer, still in his trance, said that if they looked out the window they would see a flying saucer over DC. The other three men went to the window and were amazed to see a UFO in the sky – a description of which has never been released. However, it *has* been established that at the time of the supposed sighting, the radar center at Washington National Airport reported that its radar returns had been blocked out in the direction of the sighting.'

Epstein glanced up at the night sky, saw dark clouds drifting lazily, lowered his gaze and stared forlornly at the snow, rubbed his eyes, coughed again.

'So,' Stanford said. 'Major Robert J. Friend – who had since replaced Captain Gregory as head of Project Blue Book – was informed of these events by the CIA and asked to sit in on a latter trance session during which, reportedly, nothing unusual took place. Nevertheless, Friend felt that Duke University's parapsychology lab should investigate both the female psychic and the intelligence officer, which subsequently they did… but their report never materialized, Blue Book released no analysis of the UFO sighting report, the government did nothing about the Washington radar blackout, and what the intelligence officer saw over DC remained a tight secret. Not only that, but the CIA then took, quote, "punitive action" against the men involved, and had them transferred to other positions in other locations.'

'That story is authentic,' Epstein said. 'Major Friend wrote about the whole affair in a Memorandum for the Record – a memorandum that can now be found in the Air Force Archives at Maxwell AFB, Montgomery, Alabama.'

'Right,' Stanford said. 'And that's exactly what got Scaduto going… First, Scaduto wondered at the unusual amount of official interest shown in a civilian female with supposed telepathic abilities. Scaduto was aware that the Russian KGB and the CIA had both been investigating the espionage potential of telepathy, psychic photography and other forms of

parapsychology, and he therefore wondered if there could be any connection between that fact and the female psychic from Maine. Since communication by telepathy had already been achieved with moderate success both in Russian and American laboratories, and between submarines and land bases, it was possible that the CIA was genuinely concerned with the woman's knowledge of the more complex aspects of space flight. It also stands to reason, since they themselves were interested in the espionage potential of telepathy, that they would have certain men trained in ESP – thus, they'd sent one of their men to attend the trance sessions.'

'I don't see what this is leading,' Epstein said.

'Patience,' Stanford said. 'The first thing Scaduto had to accept was that telepathic communication had been made with *someone* in that CIA office in Washington, DC, and that the man in a trance, if not actually making it materialize, had been informed that there was a UFO in the sky. If he then kept in mind the fact that certain secret military laboratories had succeeded in training people in telepathic communication – which had been done in primitive fashion years before

– it then seemed more believable that the woman from Maine had actually been in contact with some telepathically trained *government* employee.'

'Wait a minute,' Epstein said, looking a lot more interested. 'Are you suggesting that the UFO over Washington, DC, was a *government* aircraft?'

'Yes,' Stanford said. 'And for Scaduto, this possibility became even more intriguing when he thought of the US Navy Intelligence's interest in the matter; and, even more intriguing, when one of the members of the NICAP's board of directors, reminded him that the Canadian government and the US Air Force had both acknowledged their involvement in supposedly unsuccessful flying saucer construction projects.'

Epstein stopped walking, glanced up at the night sky, then looked all around him, at the snow on the ground, at the discos and restaurants and bars, his eyes bright with excitement.

'I'm hungry' Stanford said. 'Let's get something to eat. Also, I'm not keen on all this working and I'd like to sit down.'

They went into Clyde's, instantly savouring the warmth and the saloon atmosphere; once seated, they gave the waitress their orders and didn't speak again until she left. Stanford studied Epstain's face: he looked alive, but more alive. Stanford thought of them both, of Epstein's fate and his own

obsessions, and he had to control the cold rage that now drove him relentlessly. His old friend was soon to die. The pains of cancer now assailed him. Stanford wanted to give him something – all the answers – before death cut him down.

'Okay,' Stanford said. 'Bear in mind that at least *some* kind of flying saucer prototypes had actually been built by the US and Canada: first, the US Navy's Flying Flounder and the Air Force's Flying Flapjack – projects reportedly worked on between 1942 and 1947 – then the mysterious flying saucer that the Canadian government claimed they had aborted and passed over to the US in 1954. Now, the most interesting thing about those projects was that, one, the US Navy claimed to have dropped their project back in 1947, but were known to be still involved in super-secret aeronautical projects scattered around the White Sands Proving Ground; and, two, the Canadian government, while admitting that the enormous UFO seen over Albuquerque in 1951 was similar to the one they had tried to build, then claimed that they had passed their project on to the US because they couldn't afford to continue it.'

'So what you're saying is that the UFO over Albuquerque might have been a US product based on the 1947 Canadian designs.'

'Correct… And that everyone who admitted that they'd once tried building flying saucers, were now denying that they'd succeeded. Which could well be a lie.'

'I see,' Epstein said.

'Now remember,' Stanford continued, 'that Scaduto had started to investigate these mysteries in the Year of our Lord, 1959. One of the things he remembered was that the first major UFO sightings – the Kenneth Arnold sightings of June 24, 1947 – had taken place near Mount Rainier in the Cascades in the state of Washington – which divides Canada from Oregon – and that Arnold had stated that the *nine* UFOs had flown off in the direction of the Canadian border. What is *not* so widely known is that on the very same day another man, Fred Johnson, prospecting about four thousand feet above the Cascades, reported seeing six similar objects, and that three days before, on June 21, Harold Dahl, on harbor patrol in Puget Sound – which runs from the Canadian border to Tacoma – was following the coastline of Maury Island when he reportedly saw five UFOs maneuvering about fifteen hundred feet above the coast before disappearing toward the open sea. Throughout that whole month – even ignoring the crank reports

encouraged by the initial sightings – there was a disturbing number of sightings over the northwest corner of the United States; and by the first week in July there were reports of, quote, “strange, luminous bodies” in the skies over the Province of Quebec, Oregon, and New England. The following week those sightings spread to California and New Mexico, and by the end of that year – the same year that the US Navy had, apparently, *dropped* their flying saucer project – flying saucers were being reported from all over the world.’

‘So you’re suggesting that the US Navy, the US Air Force and the Canadian government were all working together to build those saucers.’

‘Yes,’ Stanford said. ‘The next major flap was the Washingto, DC, flap of 1952. On reinvestigating the case, Scaduto found that while the real flap had begun on July 19, there was a record, dated June 17, of several unidentified red-colored spheres that flew at supersonic speeds over the Canadian Air Base of North Bay in Ontario and then crossed over some of the southeastern states. He also discovered that nearly all of the subsequent DC UFOs were described as disappearing toward the north, and that when they UFOs returned *en masse*, on July 26, their disappearance in a general northerly direction also applied.’

‘All heading toward the Canadian border,’ Epstein said.

‘Right,’ Stanford said.

The waitress brought their food, set it down and smiled at Stanford, did not receive a smile in return and so flounced off in a huff. Epstein had ordered a Spanish omelet and a glass of cold milk; he drank the latter down in one thirsty gulp and then stared at the former. Stanford was distressed, feeling sorry for Epstain’s plight, but he picked up his own bacon cheeseburger and sank his teeth into it.

‘It adds up,’ Epstein said. ‘Lake Ontario and Lake Eyrie are as notorious as the Bermuda Triangle for the unexplained destruction of hundreds of aircraft and boats, the failure of gyroscopes and radio instruments, irrational behaviour in normally sane crew members and, of course, the sighting of numerous UFOs. It’s also worth noting that Canada, contrary to popular belief, is one of the greatest aeronautical powers in the world, that as far back as 1952 it had been described as the Promised Land of Aviation, that it has a truly remarkable range of world-famous aircraft companies, and that it also has vast areas of heavily wooded and uninhabited land – ideal for hiding secret aeronautical research establishments.’

‘That,’ Stanford said, ‘is what Scaduto found out. So, the next thing he had to ascertain was whether or not the Canadian saucer project had *really* been passed on to the US Air Force and if the Air Force had then simply dropped it.’
‘And the answer was both accounts was “No”.’
‘Correct. His research revealed that on February 11, 1953, the *Toronto Star* announced that a *new* flying saucer was being developed at the Avro-Canada plant in Malton, Ontario – ’
‘The word “new” suggesting that it wasn’t the first one.’
‘Exactly. Then, on February 16, the Minister of Defense Production, C. D. Howe, informed the Canadian House of Commons that Avro-Canada was in fact working on a, quote, “mock-up model of a flying saucer, capable of flying at fifteen hundred miles an hour and climbing straight up in the air.” By February 27, Crawford Gordon Jr., the president of Avro-Canada, was writing in the *Avro News* that the prototype being built was so revolutionary that it would make all other forms of supersonic aircraft obsolescent. Next, the *Toronto Star* was claiming that Britain’s Field Marshal Montgomery had become one of the few people ever to view Avro’s mock-up of the flying saucer, and short after that Air Vice Marshal D. M. Smith was reported to have said that what Field Marshal Montgomery had seen was the revolutionary construction plans for a gyroscopic fighter whose gas turbine would revolve around the pilot, who would be positioned at the center of the disk.’
Epstein winced with pain, ignored his Spanish omelet and swallowed a tablet; he washed the tablet down with a glass of water and then looked right at Stanford.
‘Good God,’ he said. ‘I think I remember it. The American media dubbed that then legendary machine the *Omega* and in 1953 the *RAF Review* gave it a semi-official respectability by reprinting most of the unclassified Canadian research and including doctored drawings of the machine.’
‘What did it look like?’ Stanford asked.
‘According to the sketches, it was a relatively small, horse-shoeshaped flying wing, with numerous air intake slots along its edge, ten deflector vanes for direction control, a single pilot cabin topped by a cupola of transparent plastic, and a large turbine engine that revolved around the vertical axis of the main body.’
‘Fantastic,’ Stanford said. ‘Now listen to this. In early November, 1953,

Canadian newspapers were reporting that a mock-up of the *Omega* had been shown on October 31 to a group of twenty-five military officers and scientists; then, in March the following year, the *American* press was claiming that the US Air Force, concerned at Soviet progress in aeronautics, had allocated an unspecified sum of money to the Canadian government for the building of a prototype of their flying saucer, that the machine had been designed by the English aeronautical engineer, John Frost – who had worked for Avro-Canada in Malton, Ontario – and that it would be capable of either hovering in midair or flying at a speed of nearly two thousand miles an hour. This hot bit of news was followed by Canadian press assertions that their government was planning to form entire squadrons of flying saucers for the defense of Alaska and the far regions of the North, and that the machines would require no runways, were capable of rising vertically, and were ideal weapons for subarctic and polar regions.'
'Did the Canadian government make any comment about all this?'
'Not until December 3, 1954, when they suddenly announced that the flying saucer project had been abandoned.'
'Any reason?'
'Oh, yeah. Because, although it was believed that the saucers would fly, they would, quote, service no useful purpose. The Minister of Defense then confirmed their decision, adding that the project would have cost far too much for something that was, in the end, highly speculative.'
Epstein picked up his fork, poked distractedly at his omelet, set the fork down again and glanced around him, his normally weary gaze still excited.
'All right,' he said. 'All these facts merely confirmed what your friend Scaduto had known for some time: that the Canadian government had officially dropped their saucer project in 1954.'
'I would stress the word "officially",' Stanford said.
'Why?'
'Because that announcement by the Canadian government was clearly contradicted on October 22, 1955, when the US Air Force Secretary, Donald Quarles, released an extraordinary statement through the press office of the Department of Defense. Among other things he said that an aircraft of "unusual configuration and flight characteristics" would soon be appearing, that the US government had "initiated negotiations" with the Canadian government and Avro-Canada for the preparation of an experimental model of the Frost flying disk, and that the aircraft would be

mass-produced and used for the common defense of the subarctic area of the continent.'
Epstein rubbed his eyes, studied his omelet with distaste, then returned his gaze to Stanford and smiled, his hands spread on the table.
'So what am I to make of all this?' he asked. 'First, the Canadian government announces that they have abandoned their saucer project. Next, ten months later, the US Air Force officially announces that such a project is underway. Was it or wasn't it?'
'It was,' Stanford said. 'By February 1959 the press was receiving ambiguous Air Force statements about a revolutionary new aircraft that had been undertaken jointly by the US Air Force, the US Army and the Canadian government. Then, on April 14, during a press conference in Washington, DC, General Frank Britten implied that the first test flight of the aircraft was imminent and that it was destined to revolutionize traditional aeronautical concepts.'
'That doesn't necessarily imply a saucer.'
'It did,' Stanford said. 'In August, 1960, the Air Force, giving in under pressure, allowed reporters to view the very machine they had all been writing about. What the reporters were shown was the Avro Car, an experimental aircraft that combined the characteristics of air-cushion machines and airplanes – in short, a crude flying saucer based on the principles of the jet ring and barely able to rise above the runway. Small wonder, seeing this, that they experienced no surprise when, in December the following year, the Department of Defense announced that they were withdrawing from participation in the project.'
Stanford finished off his bacon cheeseburger, wiped his lips with a paper napkin, then sat back and stared intently at Epstein, not smiling at all.
'There the story of the *official* flying saucers ended,' he said. 'Scaduto spent months trying to work out what it all meant, but in the end he grew increasingly baffled. First, he tried to find a correlation between the fact that an awful lot of UFOs seemed to come from and return to Canada and the fact that the Canadian government had been engaged in trying to build flying saucers – but there could be no remote comparison between the capabilities of the unknowns and the pathetic performance of the government-sponsored saucers. On the other hand, there were a few lingering mysteries…'
'Let me try to guess,' Epstein said. 'Why did the Canadian government

announce that they had dropped their flying saucer project when in fact, at least according to the US Air Force, they were still working on it? And why did the US Air Force Secretary announce that aircraft like flying saucers would soon be flying? And why, after that announcement, was there a four-year gap – with no sign of the magical aircraft – before a remarkably similar announcement was made? And why, after this latest announcement, did the Air Force unveil their magical offering, let it be known that it was a failure, and then announce that they were dropping the project? And finally, why, if the Canadians had genuinely dropped their flying saucer project, did the US Department of Defense, in announcing the termination of their own project, state that they were *withdrawing* from *participation* in the project? Withdrawing from participation with *whom*?'

'Those were the burning questions,' Stanford said. 'The suspicion remained that the Canadian government and the US Air Force were both still involved in the construction of flying saucers, that those saucers were vastly more advanced than the rubbish the Air Force had deigned to show us, that some of the supposed UFO landings on or around various top-secret military establishments were actually the products of Canadian-US cooperation, and that the Canadian and American statements, with their contradictions and ambiguities, had been designed to deliberately confuse the facts and turn them into rumors.'

'Good God,' Epstein said.

Stanford didn't smile at all. He paid the check and stood up. Epstein followed him out into the street and turned his fur collar up. Neon lights flickered spasmodically. The snow was turning to slush. The street was crowded with beaded youngsters and politicians and whores, with well dressed secretaries and generals wearing suits, all defying the biting cold. Stanford headed for M Street. Epstein coughed at his side. They both walked in a deliberately casual manner, rarely looking around them.

'Anyway,' Stanford said eventually, 'unable to solve the mystery, Scaduto finally had to let it go. Then, in 1965, it all came back with a bang.' Glancing up at the sky, scarcely aware that he was doing so, he saw a patch of glittering stars above the clouds, the black void all around them. 'In 1964, 1965 and 1966 there were three singular events that really put the Air Force in a fix. It was the culmination of those events that finally stung the Air Force into getting rid of its much publicized Project Blue Book – and that also encouraged Scaduto into re-examining the whole Canadian

mystery. The first of these events was the close encounter of the third kind of Socorro, New Mexico, in 1964, when Deputy Marshall Lonnie Zamora claimed to have seen two schoolboy-sized people in coveralls standing beside an egg-shaped, metallic craft that was resting on legs extending from its body. The machine took off with a roar, spitting flames and ascending vertically, before Zamora could get down there to investigate.'

'An extraordinary case,' Epstein said. 'Witnesses, including Allen Hynek, later confirmed that the four landing marks and the burned greasewood plants, a local verified that he had seen Zamora's squad car heading toward a strange, oval-shaped object that was descending in the direction of the sighting, and a check with NASA, the Jet Propulsion Laboratory, and fifteen industrial firms to see if they were working with experimental lunar landing modules in the area received nothing but negative replies. Hynek later described the incident as one of the major UFO sightings of all time.'

'Jesus,' Stanford said, 'your photographic memory's better than mine… Anyway, that was the first event. The second was when, on March 20, 1966, at Hillsdale College, Hillsdale, Michigan, *eighty-seven* female students and a civil defense instructor saw a glowing, footballshaped object hovering over an empty swamp a few hundred yards from the women's dormitory, repeatedly racing at and retreating from the dormitory, dodging an airport beacon light, and generally flying back and forth for hours before disappearing – and when, the next day, in Dexter, Michigan, five people including two police officers reporting seeing the same. The third event was merely the widely reported fact that by 1966 a Gallup poll had indicated that approximately *nine million* Americans thought they had seen a UFO. It was these major events, plus the Great Northeast Blackout of November 9, 1965, that led directly to the infamous Condon Report and the final closing down of Project Blue Book. Now while the Great Northeast Blackout was actually the second incident, I've left it to the last because it was the incident that really resurrected the Canadian mystery at the NICAP – particularly with Scaduto.'

Stanford saw Epstein swallowing another tablet while passing the numerous pedestrians on the sidewalk as if they didn't exist. His old friend looked exhausted and very ill, which made Stanford feel both helpless and angry.

'As you already know,' he said, 'there's a long history of UFOs being seen over power lines and of subsequent, unexplainable power failures. Now, during the first week of August, 1965, thousands of people in Texas,

Oklahoma, Kansas, Nebraska, Colorado and neighbouring states witnessed one of the biggest UFO displays ever. Unidentified lights flew across the skies in formation, were tracked on radar, and played tag with civilian and Air Force aircraft. This major display of UFOs eventually faded away, but a milder flap continued over the next three months until, on the night of November 9, unidentifieds were reported from Niagara, Syracuse and Manhattan. Then, the same night, all the lights went out – in Connecticut, Massachusetts, Maine, New Hampshire, New Jersey, New York, Pennsylvania, Vermont and a section of Canada – went out over a total area of eighty thousand square miles and a population of twenty-six million people.'

'I remember it,' Epstein said. 'The huge power grid that controlled all those blacked-out areas – an interlocking network linking almost thirty utility companies, with hundreds of automatic controls and safety devices – was considered to be invulnerable… yet the cause of the blackout was never ascertained.'

'Right,' Stanford said. 'They never found out what caused it. The only thing they knew for certain was that the failure had occurred somewhere in the flow between the Niagara Falls generators and the Clay power substation, an automatic control unit through which the electric power flowed from Niagara Falls to New York.'

'There was a UFO connection,' Epstein said.

'Yes,' Stanford said. 'First report of an unidentified was made by the Deputy Aviation Commissioner of Syracuse, Robert C. Walsh, and several other witnesses, all of whom, just after the power failed at Syracuse, saw what resembled a huge fireball *ascending* from a fairly low altitude near Hancock Airport. Approaching for a landing at that time was Flight Instructor Weldon Ross and his passenger, computer technician James Brooding, both of whom saw the same object, at first mistaking it for a burning building on the ground – something corroborating the fact that the fireball was at low altitude – then quickly realizing that it was something in the air: a single, round-shaped object about a hundred feet in diameter, which they later described as a flamecolored globe. And, according to Ross's calculations, that object was directly over the Clay power substation.'

'So,' Epstein said, 'we're back with Canada.'

'*Yes*,' Stanford said with some emphasis. 'For obvious reasons this whole

damned mess resurrected the Canadian mystery at the NICAP, particularly with Scaduto. Now, more than ever, he was convinced that there was some sort of connection between Canada and the UFO phenomenon. He was convinced even more of this when a friend pointed out that until the United States defensive radar network was extended to the Far North, which was in 1952, Soviet long-range reconnaissance planes from Siberian and subarctic bases had flown frequently over Alaska, the Yukon territory, and the MacKenzie District areas to spy on what was supposed to be relatively uninhabited territory. This just didn't make sense. What the hell were the Soviets spying on? And so wondering about this, Scaduto pulled out his Canadian files and started working again.'

They crossed M Street, drawn forward by the traffic lights, turned left on the sidewalk and kept going, rarely looking at anything. Eventually they turned again. They both walked like blind men. The residential streets were empty and quiet, the snow gleaming in darkness.

'Scaduto found nothing new in the files,' Stanford said, 'but by accident he finally struck gold. One of the members of the NICAP board of governors had managed to run down one of the CIA agents who'd been transferred after the Woman from Maine affair. This agent, who'd been transferred to London, England, before being eased out of the service, was naturally feeling embittered and was willing to talk as long as it was off the record. Consequently, Scaduto met him in a room in the Drake Hotel in New York, and what Scaduto was told knocked him out.'

Epstein shivered with cold, rubbed his eyes and coughed painfully, cursed softly, but kept listening to Stanford.

'Apparently,' Stanford said, 'one of the agent's assignments in the CIA was to undergo specialized training in Duke University's parapsychology lab, the psychology department at McGill University in Canada, and a sensory-deprivation establishment at Princetown. The purpose of all this was to open his mind – a naturally responsive one – to mental telepathy, sightless vision and psychokinesis. The reason for this, it was explained to him, was that the US was about thirty years behind the Soviets in this field, and that the Russians were already employing such skills for espionage purposes.

'After a year of training, the agent found that he could, like Ted Serios, cause photographs to appear on a film by merely focusing intently on the camera. A year after that, in 1959, he was working with US Naval Intelligence with the US *Nautilus*, the then renowned atomic submarine.

And that same year, when the press exposed the *Nautilus* experiments, he was transferred back to Washington, DC, to work with the female psychic from Maine.

'During his first session, in the presence of the psychic, the agent wasn't able to make contact. However, at the second session, in the CIA office in DC, when the woman wasn't present, he went into a trance and made contact with *someone*. Now, like the woman from Maine the agent was scribbling down, automatically, what it was he was hearing in his trance. He never actually found out what he wrote… because by the time he woke up one of the senior officers present had spirited the message out of the office.'

'So they didn't want him to know who he was talking to.'

'Correct,' Stanford said. 'No matter: when he finally woke up he found everyone at the window, all excitedly scanning the sky where the UFO, apparently, had been. Intrigued – and annoyed because his notes had been stolen from him – the agent later had a clandestine meeting with one of his colleagues and asked him if the UFO had been real. His colleague, pretty drunk at the time, told him that it was real, that it was part of a top-secret government project, and that one of the crew on board had been ESP trained. The woman from Maine had picked up his thoughts by accident.'

They were nearing Epstein's house, the streets were empty and quiet, and Epstein kept his head down, breathing harshly, coughing too much, his head filled with what Stanford was telling him, his heart pounding excitedly.

'That wasn't all,' Stanford said, speaking almost in a monotone, his gaze fixed on the street straight ahead, on the tall, brownstone buildings. 'According to the agent's colleague, the UFOs reported to have landed at Cannon AFB, Deerwood Nike Base, Blaine AFB and, apparently, Holloman AFB, actually existed. Those saucers were the products of years of highly secret activity between the Canadian and United States governments – but in no way did they resemble the aborted projects that were leaked to the press. They were, in fact, highly advanced flying saucers of the most extraordinary capability – and there was a total of about twelve in existence.'

Now Epstein felt really excited. He ignored his aching stomach. He didn't sense Stanford's rage, had no thoughts of betrayal, felt nothing but an exalting vindication of all he had lived for. The UFOs existed. He had not pursued phantoms. He could die without dwelling on failure, and that made it all worth it.

‘Only twelve?’ he asked instinctively, still a researcher first and foremost, needing every detail to hand.
‘Yes,’ Stanford said. ‘According to the agent, his colleague had previously been seconded to the Royal Canadian Air Force Intelligence where he was given the task of implementing internal security on the flying saucer project. This project, he soon discovered, had been in existence since 1946, and was being run jointly by the Canadian government, the US Air Force and Navy, and a few high-ranking officers from the Pentagon. They had managed to maintain secrecy by locating the underground productions plants in the vast, deserted regions of southern Canada between British Columbia and Alberta; by ensuring that production of the numerous components for the saucers was distributed between hundreds of different, international companies, none of whom could have guessed what they were for; by undertaking the more specialized research in the super-secret installations of the White Sands Proving Ground and similar establishments all over Canada; and, finally, by deliberately confusing the media and public with a continuous stream of ambiguous leaks and misleading statements. In other words: those saucers are real and they’re hidden in Canada.’
Epstein stopped at the street corner, turned around to stare at Stanford, looking up, his eyes bright in the lamplight, flecks of snow on the gray beard.
‘You *do* realize,’ he said, ‘that this leaves a mere twelve saucers to account for all the sightings of the past thirty years?’
‘Yes,’ Stanford says, ‘I realize that. But it’s not what I’m saying.’
‘Oh? And just what *are* you saying?’
Stanford didn’t hesitate. ‘It transpires that the Allied Air Forces had been harassed by UFOs – mostly in the shape of balls of fire – from as far back as 1944. Then, shortly after the war, in the summer of 1946, the more familiar types of UFOs, mostly cigar-shaped, swarmed across Scandinavia, seemingly coming from the direction of the Soviet Union. The conclusion at the Pentagon was that German scientists, seized by the Russians at Peenemünde where the V-2 rockets had been developed, were constructing advanced weapons for the Soviets, and that the unidentified, so-called *missiles*, were being launched from the rocket test site of Peenemünde, which was then in the Russian-occupied zone of Germany. This suspicion became stronger when the British, who had also seized and taken back to

Britain a wealth of Germany's top-secret scientific and weapons research material, announced that the Germans had been working since 1941 on extraordinary aeronautical projects and on processes to release atomic energy. Included in the former was a "remotely controlled, pilotless aircraft" and a "device that could be controlled at a considerable distance by another aircraft." So, faced with this, and thinking of the supposed Soviet *missiles* over Scandinavia, there was a sudden British-Canadian-United States alliance to beat the Soviets in the race to follow through the German designs and complete their remarkable aeronautical projects.'

They stood together at the corner, a cold wind beating at them. Stanford was totally humorless, his eyes unusually intense, and Epstein looked up at him in wonder, either dazed or still doubtful.

'Listen!' Stanford said. 'As we've just been discussing, the actual concept of a flying saucer is not a new one. The US Navy and the British Navy have both been interested for a long time in the possibility of constructing either a vertical rising aircraft or a simpler air-cushion machine that would be particularly suitable for use at sea. Regarding this, the Navy Flounder and the Flying Flapjack were crude examples of the former, the normal Hovercraft a perfect example of the latter. However, what they were attempting to build in the underground plants in Canada was a machine with the extraordinary capabilities of the ones suggested in the incomplete German research material. They wouldn't achieve this goal for another twenty years, but the first, extremely crude versions of their saucers were successfully tested over the Canadian border on June 21, 1947: a total of five disk-shaped aircraft, two of them piloted and approximately fifty feet in diameter, the remaining three remote-controlled by the pilots flying nearby, these three a mere six feet in diameter. These particular flying saucers could reach an altitude of approximately seven thousand feet, could hover uncertainly in the air, and had a horizontal speed of about six hundred miles an hour.'

'That test flight,' Epstein said, 'could account for the Harold Dahl sighting of that same day.'

'Right,' Stanford said. 'However, it was what happened *after* that test flight that really got the ball rolling. On June 24, three days after the first successful test flight of the five Canadian-US saucers, a total of nine, highly sophisticated, *unknown* saucers flew down over the Canadian underground plants, hovered there for about twenty minutes, shot off toward the

Cascades where they reportedly circled the test area, then returned, circled the plant for another twenty minutes, then shot off at incredible speed. And from that day on – the day, incidentally, of the famous Kenneth Arnold sightings – those UFOs, and others, returned again and again, eventually spreading out across the whole world.'

Epstein stepped back and covered his mouth with a hand, his eyes too large and very bright, his body visibly shaking. Stanford watched him, saying nothing, waiting for him to recover, finally saw him removing his hand from his mouth and shaking his head in confusion.

'My God,' Epstein said, 'are they Russian?'

'No,' Stanford said. 'The agent's colleague, during his tenure at the flying saucer plant in Canada, never found out who those saucers belonged to. What he *did* find out was that some time during the Cold War the Pentagon received proof that the unknown saucers didn't originate in Russia – and that the Russians had been harassed by the very same objects. He also found out that they were *not* from outer space, that the Pentagon probably knew where they came from, and that Canada and the United States were racing to build similar machines, because the unknown saucers, even as far back as the Fifties, had the sort of maneuvering capability that made them virtually invincible.'

Epstein turned around and walked away. Stanford followed him around the corner and saw him stopping again. He seemed to be frozen. He was staring across at his own house. Three men in dark suits were coming out of the house and walking toward a black limousine. Epstein offered a strangled cry. The three men all looked up. Epstein started running across the road toward them, his heavy overcoat flapping. Stanford cursed and ran after him. The men slipped into the car. The car's headlights flashed on, forming a dazzling pool of light, and then the car roared and shot off down the street. Epstein stopped and stared at it. Stanford slid to a halt behind him. The car slowed down at the far end of the street, turned the corner and vanished.

Epstein cursed and lurched onward, almost slipping in the snow. He and Stanford reached the brownstone together and found the door open. They both hurried inside. The whole house had been ransacked. Epstein kept looking around him, his eyes dazed, uncomprehending, then he groaned and covered his face with his hands and dropped into a chair.

'Bastards!' Stanford hissed. 'They've got us marked!'

He reached down and grabbed Epstein, pulled him up to his feet, shook him until his hands fell from his face and his eyes were wide open. He held Epstein by his shoulders, trying to keep his old friend steady, then he spoke in a low and urgent voice that gave Epstein his strength back.
'Listen to me,' Stanford said. 'I didn't stop at Scaduto. I conducted some investigations of my own and this is what I discovered.'
'I discovered that the mysterious fireballs seen frequently over Nazi Germany disappeared for good when the Second World War ended. I discovered that the Russians, the British and the Americans divided the scientific spoils of Germany between them, and that some of those spoils were rumored to be related to the German fireballs. I also discovered that the British had received the major portion of this scientific booty, and that they had, in 1945, sent back secret German aeronautical equipment and papers to be distributed to their experimental research centers in Australia and Canada.
'I discovered that by 1947 certain British aeronautical establishments were experimenting with such bizarre Germany concepts as a supersonic flying wing, a gyroscopically stabilized pilot's cabin surrounded by a revolving turbine engine, and a suction airfoil shaped like a meniscus lens – or like a fucking great mushroom. And finally, I discovered that in 1946, with the encouragement of the British government, there had been a mass migration of aeronautical establishments and their workers from their original English production centers to the vast, uninhabited regions of southwest Canada.'
'So,' Epstein said. '*What does it mean*?'
'What I believe,' Stanford said, 'is that the Canadian and American governments, quietly backed by the British, have been working jointly since the end of the Second World War on the development of supersonic flying saucers, that they now have a limited number of such machines hidden away in the wilds of Canada or in the White Sands Proving Ground, and that those saucers are based on aeronautical projects that originated in Nazi Germany, but aren't related to the vast majority of UFO sightings. What I also believe is that the US government knows the origin of the more extraordinary saucers, that it's frightened of what the capability of those saucers might represent in military and political terms, and that its building of its own saucers is a race against time and its secrecy a means of avoiding national panic. Finally, what I believe is that the government has to keep its secret, that it will murder to do so, and that the deaths of Jessup and Hardy,

of Dr McDonald and Irving Jacobs, are examples of how far the government will go to keep the lid on the pan.
‘The Canadian government has flying saucers. The US government has flying saucers. But someone, *somewhere*, has flying saucers so advanced we can’t touch them. Those saucers don’t come from space. They aren’t figments of imagination. They are real and they are right here on Earth and their source is a mystery.’
Epstein pushed himself away, spinning around, bumping into a chair, then he hurried across the wrecked room, past his pillaged belongings, and jerked the curtains away from the windows to look up at the stars. He stood there a long time, didn’t once rub his beard, and when he finally turned back to face the room, his eyes were glazed with an intense, haunted brilliance.
‘I’m going to Paris,’ he said.

Chapter Twenty-Four

I owe Kammler and Nebe. Without them, I would not be here. That I killed them was not a sign of malice but of simple expediency. I think of it often. What I did, I had to do. The deaths of Kammler and Nebe were necessary for the good of the colony. They were both becoming greedy. They wanted power for themselves. They were more concerned with politics than science, and I knew what that meant. Plots and counterplots. The introduction of intrigue. A dissension that would interfere with work and thus hinder our progress. Such a possibility could not be tolerated. We had come too far for that. For that reason I had them gassed as they slept, then I took over the colony.

Yet I recognize my debt. Without them, I would not be here. I never liked them, but they did what was required and made good our escape. We left Germany behind us. We embraced the world of ice. Beneath the ice, in the immense, towering caves, thousands slaved to support us. The colony grew quickly. Without dissension there was progress. Our medical and scientific experiments led to wondrous achievements.

I was racing against time. I was sixty-six years old. What I did in the laboratories in the ice was a necessary evil. What I did, I had to do. If I

died before my work was completed, the colony would flounder. I had to make it self-sustaining. The workers had to be controlled. Sooner or later, even the guards with the whips would have negative thoughts. This could not be allowed to happen. The control had to be automatic. I was obsessed with the mysteries of the brain and biological mutation.

What I did, I had to do. The slaves writhed beneath my knife. The gray matter of their brains was explored; lungs and hearts were examined. Their blood was my life's blood. What they suffered was necessary. Vivisection on animals is useful, but has grave limitations. So, I operated. The experiments were not pleasant. Many died and many more became crippled and had to be terminated. Nonetheless, I progressed quickly. Without law there are no boundaries. The mystery of human life was unraveled as it writhed on the tables.

I was aging every day. I felt the fluttering of my heart. My skin was tightening across the cheekbones of my face and my stomach was addled. This frustration was energizing. I spent months in the laboratories. The experiments in the camps of Nazi Germany now bore splendid fruit. Hearts and lungs were transplanted. Prosthetic arms and legs flourished. Many died on the tables, those maimed were terminated, but our gains soon overcame the cost and encouraged us further. Gerontology was a priority. My own aging was the spur. We experimented with various drugs and surgical aids and had dramatic results. Naturally we made mistakes. There was paralysis, palsied limbs. Nevertheless, with application and will, we eventually met with success. At first it was modest. Vitamin pills and various stimulants. They, however, were just a beginning and soon led to much better things. I myself was thus saved. The first injections renewed my vigor. Within a year, with my heart at full strength, I could receive the pacemaker. A tentative first step. The artificial stomach followed. Years later would bring the plastic surgery and the minor prosthetics.

The means of control were urgent. This goal obsessed me next. I was aware that even the most fanatical guards would eventually yearn for the outer world. Human nature is a curse. It is weak and quite irrational. What I wanted was a method of control that would make the guards obsolete.

I exposed the human brain. Once exposed, it is a blancmange. No mystery: just tissue and fibers, blood and acid and water. I experimented with the brain. I specialized in living subjects. I discovered that by tampering with certain cerebral areas, the mental processes of the brain could be altered in any manner required. I inserted microscopic electrodes. I had them activated by computer. Thus, at the press of a button, I could introduce pain or pleasure, craven fear or brute aggression, numb acceptance or insatiable curiosity, heightened intelligence or idiocy. This discovery was invaluable. It was promptly utilized. Within months, implantation of the workers was well underway.

We were masters and slaves. The latter were virtually robotized. The former were still controlled by Artur Nebe, but were clearly redundant. The slaves had all been implanted. The whips were no longer needed. The only danger of revolt now resided in the guards and technicians. Nebe recognized this danger. He gave permission to implant. We both knew that this could lead to resistance, so we had to work carefully. It took us two years. We performed the implants one by one. We anesthetized the men while they were sleeping and then stole them away. The operation was simple. The men were programmed to forget the implants. When they awakened, they would not seem any different to those still untouched. After two years it was finished. There were no untouched left. Only Kammler and Nebe and myself were allowed to go free.

Every member had his function. His every thought was controlled. Every man, woman and child was robotized and had his course mapped out for him. Their desires were my desires. Their needs were my needs. I ordained their pain and pleasure, their every hunger, and was worshipped accordingly.

The implantations were all different. Some severe, some less so. What mattered was that each individual would perform as required. To drain a mind is to kill it. One must drain only a little. One must leave free those cerebral areas that perform certain functions.

The technical staff were least affected. I left them the spur of discontentment. This discontentment only related to their creative urge and did not go beyond that. What I removed was their hostility. What I enhanced

was their love for work. Given this, they were almost like normal men, but lacked personal ambition.

Below the technical staff were the administrators. Such men and women were more affected. Required for systematic tasks, uncreative and repetitious, they were programmed to be wholly positive thinkers, enthusiastic and dedicated. They were drained of discontentment. Their work triggered satisfaction. In frequent contact with the scientists, who were almost like normal men, the administrators had minimal personality and no thought for themselves.

The lowliest workers were most affected. I could allow them no personality. I think of Nebe's soldiers, of the factory workers and secretaries, of the drivers and laborers and cooks who performed simple tasks. All were heavily implanted. All were drained of personality. All were programmed to perform their given tasks without reason or thought. In a real sense they were robots. They experienced few emotions. Much cheaper and more reliable than cyborgs, they had a minimal consciousness.

What an achievement this was! The first perfect society! No waste, no crime, no need for debate, no insubordination or rebellion, no conflict of any kind. Such a society is a miracle. It is also highly productive. With no digressions for politics or conflict, it can advance by extraordinary leaps. It can and ours did. We rode the whirlwind and conquered it. Within two years our saucers were creations of an awesome complexity. Jet propulsion was obsolete. Atomic energy was routine. And even this, given the benefit of hindsight, was but a modest beginning.

I see the saucers as I sit here. They soar vertically from the wilderness. As I observe them, they glide across the sky and cast their shadows on mountain peaks. The sun beats all around them. They merge with the flashing ice. They ascend vertically and the hover in silence, their inertial shields glowing.

I confess: I feel pride. Inhuman? I cannot be. As I sit here on the mountain, as I gaze out through the windows, the beauty of the saucers above the snow makes me feel like a young man.

A divided society could not have accomplished it. Certainly not in that brief period. I would not have accomplished it myself had I ignored Nebe and Kammler.

They both wanted to leave the wilderness. They wanted to regain what they had lost. Simple men, moved by normal, pointless hungers, they wanted cheap, instant glory. The saucers offered that opportunity. They knew the saucers were invincible. They wanted to use the saucers to plunder the Earth and make it bow down before them.

I did not desire the same. I wanted only my work. My new cathedrals were made of ice and stone, my sole religion was science. I did not want that changed. I knew that conflict would change it. I also knew that with patience and time there would be no need for conflict.

The saucers rendered us inviolable. Their very existence was our security. What we needed, we could obtain from the outer world if we handled it properly. Meanwhile, we could progress. We could increase our capabilities. If we did so, we would be in a position to gain much with no effort. The outer world would have to join us. We would gradually draw it in. Given time, the outer world would surrender, turning men into Man.

Yes, given time. But Nebe and Kammler had no time. Their brains untouched by the healing electrodes, they were still normal men. They still suffered from base emotions. They felt fear and resentment. They both yearned for the world beyond the ice, and for its decadent pleasures. Vengeance and power. Material gain and the means of squandering it. Like bored children, Nebe and Kammler were inflamed with the need for attention. No, they couldn't wait. They wanted a war of their own making. They wanted to use my remarkable creations as their weapons of plunder.

I could not let that happen. Such a victory would be short-lived. Such aggression would be met with the resistance of inane politicians. Why encourage a nuclear war? What real purpose would it serve? Already our resources were running low, our needs increasing dramatically. What we needed, the world possessed. We could have it without conflict. In gaining it, we could progress even more and thus bide our own time. In the end, the rest would come. The rule of science was inevitable. A conflict such as Nebe

and Kammler wanted could only lead to mutual destruction. I could not let it happen. I had no immediate goals. My concern was for the future of science and Man's metamorphosis – I still wanted the Superman.

My intention was to trade. I needed mass-produced items: small components and tools, nuts and bolts, screws and nails, light bulbs and printing paper and pens and other modest essentials. So far we had stolen them. Our flying saucers had landed. We had often abducted human beings and machines where isolation protected us. But nuts and bolts were more difficult. Small items were large problems. What was shipped to here throughout the war years was now diminishing rapidly. No colony can be self-sustaining. I had always understood this. So it was that in 1952 I had to form an alliance. There was really no alternative. I had no choice but to trade. What I had, the world needed; what the world had, I needed; and until I had the world on my side, I would have to negotiate.

Indeed, I had already started. I was negotiating with President Truman. After the Washington invasion of 1952, he had agreed to a meeting. We met in the Oval Room. My CIA contacts were present. President Truman was an intelligent man, and as such he was nervous. He kept fiddling with his glasses. His lower lip was not too steady. General Vandenberg was standing near the desk, his eyes bright with suppressed rage. The Oval Room was crowded. General Samford and Professor Robertson. Other members of the Robertson Panel, including Lloyd Berkner. The meeting didn't take long. They had already examined my brief. Most being specialists in the physical sciences, they had no problem in reading. I put forward my proposals. Truman sighed and raised his hands. Generals Vandenberg and Samford were outraged, but inevitably out-voted. The scientists knew what they were reading. They were aware of our capabilities. They put the facts bluntly to Truman and we reached an agreement.

After that, I had no choice. Nebe and Kammler became a threat. Disgusted that I should barter instead of conquer, they started plotting against me. I have no proof of this. I just know it was inevitable. Their chance for immediate recognition and power had been ruined by my actions. They were now trapped in the colony. In the outer world they would be war criminals. The only way they could return to the outer world would be to

land as aggressors. So, they felt trapped. Thus they had to plot against me. And knowing this, I had no choice but to remove them and take over the colony.

They had not been implanted. They were men of free will. I could not, as I could with the others, suggest euthanasia. For this reason I had no choice. What I did, I had to do. I could not concern myself with individuals while my future was threatened.

Not shortly after the war, then. It was 1953. We had dinner overlooking the plateau, the snow white, the stars glittering. I served champagne and caviar. The meal was followed with brandy. Such luxuries were rare in the colony, but the night seemed to warrant it. Kammler spoke of America. He reminisced about his visits there. Artur Nebe turned his glass between his fingers, his dark eyes unrevealing. Kammler spoke of General Vandenberg. His voice trembled with loss. He said that Vandenberg had reminded him of his past, of his days with the military. Artur Nebe was not attentive. His gelid eyes surveyed the ice. He gazed over the glistening plateau to the dark, frozen wilderness. Kammler spoke of the V-2 rockets. He talked of fighting in the Hague. He recalled his days with Walter Dornberger and Wernher von Braun. The hours passed in this manner. Artur Nebe's cold eyes were veiled. A large saucer became a glowing cathedral that ascended majestically. Artur Nebe did not look up. His gaze was fixed on the wilderness. Kammler yawned and stood against the large window and was framed by the starlit night. He talked vaguely about the future. He said decisions must be made. He turned away and I saw the white wilderness dissolving in darkness.

They both left shortly after. I had no sense of urgency. The glowing cathedral descended from the heavens, hovered briefly and disappeared. I looked out and saw the ice. The frozen wilderness stretched out below me. I stood up and then went to my desk and turned on the two scanners. Kammler and Nebe were in their rooms, the latter with his whore. I reached down and pressed the button on my left and let the gas fill their lungs.

What I did, I had to do. What I do, I have to do. Above morality, above the sanctity of the individual, is my duty to science. I do not suffer guilt. They

were of use and were used. Without them, I would never have escaped – thus I offer them tribute.

Chapter Twenty-Five

Stanford climbed out of the car, closed the door and looked around him, listening to the moaning of the wind as it swept across the broad field. The sun was going down, the sky aflame with crimson light, a few drifting clouds casting the shadows that would soon die in darkness. Stanford stood there for some time. The field was utterly desolate. The flood-lights and the barbed wire had gone, but the scorched earth remained. Nothing would grow here anymore. The butchered cattle had been buried. The dust drifted lazily across the ground, emphasizing the barrenness.

Standing there alone, Stanford was drawn to the mountains beyond the flatlands. He thought of what Scaduto had told him, and it made him feel lost. The saucers didn't come from space. They weren't figments of imagination. They were real and they were right here on Earth and their source was a mystery. Stanford thought about that. To think about it was frightening. He took in the desolate flatlands, saw the bloody sinking sun, watched the dust drifting over the field and then turned back to his car.

He sat in the driver's seat, closed the door and stared ahead, thinking of the girl on the ranch and wondered what she might know. Lust grabbed him immediately, filled his head with her presence, almost making him forget what he was here for, his groin flooding with heat. Damn it, he thought, starting the car, driving off, remembering her eyes, their oddly vacant luminosity, her breasts and her thighs and her brown legs, her thumb parting her moist lips. He couldn't understand himself, didn't know what was happening to him, so drove blindly, hardly seeing the road ahead, the flatlands stretching out on both sides. What was he really doing here? Was it the girl or what she knew? Stanford shook his head wearily, feeling nervous and excited, confused by his conflicting emotions, despising himself.

The surrounding land was desolate. The crimson sky was turning dark. Stanford drove through pools of moonlight and shadow, over stones and

potholes. He thought briefly of Professor Epstein, his good friend, growing frail, now obsessed because death was at his door and the mystery that had haunted him for years still remained unsolved. He had to learn the truth for Epstein. He didn't want to fail his friend. He couldn't bear to think of Epstein fading away, his eyes tormented by failure.

Yet that wasn't the only reason. In truth, it never had been. Stanford's throbbing groin insisted on the truth and stripped the mask from his self-deceit. He was doing this for himself, his own need was his main concern, and as he drove toward the ranch he felt shame, seeing only the girl.

He also felt a little crazy. He didn't feel like himself at all. His thoughts tumbled on top of one another and amounted to nothing. He was obsessed with the girl. His lust went beyond mere sex. He had to touch her, had to break through her silence, had to bore through her tunneled eyes. This need was bewildering, an irrational, compulsive lust; it was a need for the revelations of her body, for the source of her being. What she was, was what he needed. She belonged to what she had witnessed. The was alien, a human touched by the unknown, and that made her seductive.

It was that… and much more. She had known he would come back. She had known and told him so with her smile, with her luminous, empty eyes. Not empty: concealing. Eyes that shone and quickly darkened. She had looked at him and willed him to return and now he felt enslaved by her.

Stanford didn't know what was happening, and was powerless to resist. He felt as if the girl had hypnotized him and drained him of willpower. She had known he would come back. He had known it as well. They had both made the pact three years ago without saying a word.

Inexplicable. Ridiculous. It couldn't be true, yet it was real: a web of mysteries and intriguing possibilities with the girl at its center. Her vacant eyes, suggesting all. Her languorous innocence, inviting lust. Standing thought of her standing on the porch, gazing up at the sky. She had touched and been touched. She had observed and now knew. She was silent as only the knowing are silent: secretive and inviolate. Stanford wondered what she had seen. He wondered what they had done to her. And he wondered, with a strange, hallowed awe, what she had then done to him.

He drove for another five minutes, driving blindly and dangerously, bouncing over potholes and mounds of soil until he arrived at the ranch. He slowed down when he reached the gate, stopped the car, hesitated, then opened the door and slipped out and heard the wind's lonesome moaning. The ranch hadn't changed, was still sadly dilapidated, the dust drifting forlornly along the porch, the lights burning inside. The girl was not on the porch. There was no sign of the old man. Stanford sighed and then opened the gate and closed it quietly behind him.

It was now nearly dark. The wind moaned across the flatlands. Stanford walked very slowly toward the ranch, his eyes drawn to the windows. The lights were on inside. There was no other sign of life. The only sound was the moaning of the wind, and that made him feel nervous. Eventually he reached the porch, looked up at the nearest window. He saw an oil lamp glowing fitfully between the curtains, a shelf of cracked plates and cups. Stanford glanced up at the sky. The moon glided beneath the stars. Stanford shivered and then went up the steps until he stood on the porch. There was no sound from inside. Stanford felt very strange. He stepped forward and knocked on the front door and then stepped back again.

There was no immediate response. Nothing. Stanford waited for some time. Nothing happened, so he knocked on the door again and then stepped back a little. Silence. The wind. Stanford felt a bit unreal. He stepped forward and knocked on the door again and felt his heart racing uncomfortably. That annoyed him a lot: he wasn't used to being nervous. He cursed softly and willed her to come and then he heard a faint sound. A tin mug on a tin plate. A chair scraping on the floor. Stanford took a deep breath and let it out and kept his eyes on the door. The bolt made a rasping sound. The door creaked and then opened slightly. A beam of light fell out over Stanford and then he saw the girl's face.

She stared blankly at him. Her brown eyes were too large. Stanford looked into those eyes and saw the void that led into the unknown. The girl was sucking her thumb. Stanford thought she was smiling. Her long hair tumbled loosely around her face in a dark, uncombed tangle.

'Emmylou?' Stanford said.
The girl nodded dumbly.

‘Do you remember me?’ Stanford said. ‘I was here a few years

ago. The night all the other men were here… the night the cattle were butchered.’

The girl sucked her thumb silently. The door was barely open. The girl’s body was pressed against the door, her head tilted around it. She was wearing a cheap cotton dress. Stanford saw a brown leg. The girl stared at him, possibly smiling, then she nodded again.

‘Can I come in?’ Stanford asked. ‘It’s important that I talk to you. I want to talk to you and your father. Can you tell him I’m here?’
The girl just stared at him, her thumb still in her mouth, the brown eyes too large, strangely depthless, luring him in.
‘Can I speak to your father?’ Stanford asked. ‘Is your father in there?’
The girl suddenly giggled, a high-pitched, childish sound, then she removed her thumb from her mouth and opened the door a bit wider. Stanford stared at her. He couldn’t take his eyes off her. She was wearing the same flimsy dress that she had worn three years ago, the buttons undone up to her thighs, undone down to her breasts. Stanford wanted to put it into her. He imagined himself doing it. The lust seized him with immediate, startling force and stripped his senses bare. He shook his head to clear it. He was sweating and felt feverish. The girl was leaning in a languid fashion against the door, a distant smile on her face.
‘Is your father in?’ Stanford asked.
The girl tilted her head slightly. Her eyes were focused upon him, very large, their brown depths oddly luminous. Then she giggled again. Stanford shivered a little. She stopped giggling and shook her head from side to side in a negative gesture.
‘He’s not in?’ Stanford asked.
The girl shook her head again. Stanford saw her belly pressed against the door, one breast thrusting around it.
‘You mean he’s not here?’ Stanford asked.
The girl nodded that this was so.
‘Where is he?’ Stanford asked. ‘Do you understand? I want to know where he’s gone.’
The girl opened the door wider, slipped around it like a dancer, moving with

a natural sensuality that made Stanford harden. He saw the curve of her breasts, the faint outline of her nipples, glanced down and saw a brown inner thigh, a film of dust on her bare feet. The girl pressed against the door, slid along it, moved toward him, then she passed him, brushing lightly against him, and stood out on the porch. Stanford watched her, fascinated, seeing the curvature of her spine. She leaned back and then raised her left hand and pointed up at the night sky.

Stanford suddenly turned cold. He raised his head and looked up. The sky was dark and the stars were extremely bright, the moon gliding beneath them. What did she mean? Stanford couldn't work it out. He shivered and then stepped up to the girl until he stood just beside her. She was still pointing at the sky. She turned her head to stare at him. She was smiling, a distant, disturbing smile, her brown eyes hypnotizing him.

'What do you mean?' Stanford asked. 'You mean your father's up there? In heaven? You mean that your father has died and now he's up there, in heaven?'

The girl smiled and then giggled, shook her head from side to side, indicating that Stanford was wrong, still pointing up at the sky. Stanford wished she would talk to him. He was convinced that she could talk. Staring at her, he wondered if she was mad, though that somehow seemed doubtful. The girl returned his stare. Her hand was still raised in the air. The wind was pressing the cotton dress against her body, emphasizing her breasts and hips. Stanford glanced at the sky again, seeing only the moon and stars. He looked back at the girl and she nodded and kept pointing upward.

'He's not dead?' Stanford asked.

The girl giggled and shook her head from side to side.

'He's up there?' Stanford asked. 'He's in the sky? Someone took him away?'

The girl nodded in confirmation, then dropped her hand and turned toward him. The wind blew the dress behind her legs, leaving them bare. Stanford wanted to put it into her. He wanted no more than that. It was a mindless, brutally primitive desire, and he ached with his need for her.

'Who took him away?' he asked. 'Was it the men who were here that night? Was it the Army or the Air Force or the police? Who took him away?'

The girl raised both her hands, placed them together above her head, drew them apart and lowered them gently to describe something dome-shaped. Stanford shivered, feeling cold. He also felt a distinct excitement. He

nodded to show that he understood, then the girl raised her hands again. She pointed to the sky. Her left hand was mushroomshaped. She let the hand drop in a vertical line, then knelt down and placed the hand on the porch and swept it up toward the sky again. It was an eloquent gesture, graceful, dreamlike, and then she turned around on her bare feet and slowly stood straight again.

‘They came back,’ Stanford said. ‘They came down in the strange aircraft. Your father was taken into the aircraft and then they all flew away.’

The girl nodded and smiled, put her thumb in her mouth, brushed past him and went back to the house and leaned against the doorframe. Her long legs were crossed. The dress flapped around her hips. Stanford saw the shadowed area between her thighs, raised his eyes, saw her steady, oddly luminous gaze. She was sucking her thumb, a child, perhaps insane, and Stanford flushed with a mixture of shame and primitive lust.

‘How long ago?’ he asked.

The girl’s brown eyes widened.

‘When did all this happen?’ Stanford asked. ‘How many days? How many weeks ago?’

The girl raised two fingers in a V sign.

‘Two days? Stanford said.

The girl nodded, then giggled and turned away and vanished into the house. Stanford followed her in, feeling strange, not himself, intrigued by what she had told him and by what it might mean. The house was unchanged, the oil lamps still near the windows, casting shadows on the dusty wooden floor and the makeshift furniture. The girl stood near the table, smiling at him, sucking her thumb; the shadows fell down flaking walls, crept over the old chairs, danced fitfully on and off the girl’s face, the rise and fall of her breasts. Stanford returned her smile. There was light in her brown eyes. Her left-hand thumb was in her mouth and her right arm was folded behind her back. Stanford saw her parted thighs, seeing her flesh as his salvation. The shadows flickered on her face, a pool of light around her eyes; and the eyes, which were vacant, were also bright with some vague, sly awareness.

‘Who were they?’ Stanford asked. ‘Who took your father away? Can you describe the men who took him away? What were they like?’

The girl tilted her head slightly, her knuckles pressing against her nose, her dark hair hanging down across her face and covering her right eye. Stanford thought she was smiling, but wasn’t sure, just had that feeling; he then

thought of what had happened, of the UFO descending, of the men taking her father away, and wondered how she could smile. An idiot? Possibly. Stanford wasn't too sure of that. There was a light in the brown, vacant eyes that gave hints of awareness. The girl seemed to be teasing him, her languid carnality seducing him; silent, she spoke through her body with a sly, feline eloquence.

'Who were they?' Stanford asked.

The girl giggled and walked up to him, stood very close to him, her breasts almost brushing his chest, the rising flesh lightly shadowed. She stared up at Stanford, still smiling, slightly mischievous, arched her spine and stood on tiptoe and raised her hand to his head. Stanford felt sick with longing. He had a hard, pulsating erection. The girl placed the edge of her hand against his forehead and drew it down to his chest. Stanford followed the hand down. He saw the cleft between her breasts. She moved her hand in a cutting motion across his chest, as if marking a line.

'They were all that size?' Stanford asked. 'They were small? Is that what you mean?'

The girl nodded and stepped away. Stanford moved into the shadow. His erection was tight against his pants and he wanted to hide it. The girl moved closer to him. She cupped her left hand in the air. She indicated that the men had been five feet tall, her eyes more expressive. Stanford nodded that he understood. The girl smiled and touched her forehead. She placed her hands around her neck, probably indicating a collar, then ran her delicate hands down her body in two parallel lines.

Stanford didn't understand. He was finding it hard to concentrate. The girl's hands were on her breasts, on her belly, on her thighs, pressing her own hollows and curves and increasing his lust. This wasn't what she intended. She was trying to tell him something. She waved her left hand in a negative gesure and then tried again.

Moving her hands down from her throat, drawing them away from one another, she rubbed them over the buttons on her dress as if trying to erase them. Stanford nodded that he understood. He saw the shivering of her breasts. The girl smiled and placed her hands on her shoulders and ran them straight down her sides. Her hands traced her gentle curves. She stooped down and ran her hands along her legs until they touched her bare feet.

'One-piece suits,' Stanford said. 'They were wearing one-piece suits. They were wearing some sort of coveralls and you didn't see buttons.'

The girl nodded and straightened up, a graceful movement, very sensual, the dress falling back over her legs, rippling over her breasts. She put her thumb back in her mouth. Stanford saw that she was smiling. She stared at him, her eyes more expressive, perhaps even inviting. Stanford looked her up and down. He couldn't take his eyes off her. He wanted to peel the dress from her body and press himself into her.

'Who were they?' he asked. 'I need to know where they came from. You know and I believe you can talk and I want you to tell me.'

Stanford studied her, fascinated, his will destroyed by his erection, trying to gauge what her large eyes were concealing, the room dissolving around him. The girl looked like an adolescent, ragged, unkempt, her feet dirty, her legs burned brown by the sun. Stanford heard the moaning wind. He thought of the moon and stars. The girl stood there, beside the old table, her long legs slightly parted.

'You won't talk,' Stanford said. 'Did they order you not to talk? Did they do something? Why won't you talk to me?'

The girl just smiled and sucked her thumb, then started humming a tune. Stanford watched her, mesmerized. He felt totally unreal. The oil lamp on the table burned fitfully, flickering over her face. The girl sucked her thumb and hummed. She rocked languidly to and fro. She was leaning against the table, her hip forming a graceful curve. Stanford wanted to press against her, wanted to feel her tender flesh; he felt dizzy and tense with throttled lust and hardly knew where he was.

'Who were they?' he asked.

The girl didn't reply. Stanford stared at the thumb in her mouth, at her breasts, her curved hip. The shadows flickered across her face, across the tanned skin of her throat, across the cleft of her breasts, her rocking belly, the leg exposed by the open dress. Stanford felt choked with lust. He simply had to step up to her. He stood right in front of her, very close, almost touching, and looked down into her brown, expressive eyes, seeing himself in their dark depths.

'Who were they?' he repeated. 'I know you can talk. I need to know where the men came from. I know you can tell me.'

Looking up, the girl smiled, her thumb still in her mouth, still humming, her body rocking to and fro, her warmth flowing around him. He reached out and placed his hand on her wrist and tugged her thumb from her mouth. She licked her lips in response. Her hand dangled indecisively. She smiled and

slid the hand beneath her dress and lightly scratched her right breast. Stanford felt that he was choking. He saw the hand beneath the dress. Her fingers moved up and down, scratching lightly, her palm pressed to the white skin. Stanford's heart started racing. His sole reality was his erection. He raised his hand and pressed it down on the cloth right above the girl's hand. He saw her tongue at her lips, his own reflection in her eyes, then he felt her fingers slipping away and his hand cupped her breast.

'Who were they?' he asked.

The girl offered no reply. She was still humming contentedly. Stanford felt the breast beneath the thin cotton, very soft, very warm. He pressed gently and felt the nipple. The girl continued humming contentedly. Stanford pulled the dress back and cupped her bare breast in his hand, his palm rubbing the nipple, sliding slowly, pressing down, trying to flatten it. The nipple hardened against his palm. He squeezed the warm, heavy breast. The girl hummed and rocked gently against him, her warmth saturating him. The room seemed to be dissolving. Shadows flickered across the walls. Stanford looked down at the eyes looking up. Silence. A moaning wind. His own breathing was too harsh. He took the collar of her dress in both hands and pulled the dress off her shoulders. The girl stopped humming, bit her tongue and smiled at him. Stanford slid his hands along her smooth spine, felt her sweat, tugged her to him. The girl continued smiling. Her belly was pressed against his erection. She just hung there in his arms, bending backward, her hands loose by her sides.

Stanford looked at her bare shoulders, very smooth, white; he lowered his gaze to drink in her milky breasts, the dark nipples erect. He didn't kiss the girl's lips. Her smile was distant, enigmatic. He bent over and pulled her hard against his groin and pressed his lips to her right breast. The girl quivered a little. Stanford kissed her heavy breast. He put his lips around the nipple and sucked it, his tongue licking and stroking. The girl quivered and writhed against him. He felt her hand on his head. She stroked the back of his neck and pulled him down, her breast filling his mouth.

Stanford didn't know where he was. He didn't stop to think about it. He saw lights ascending silently to the sky, blending in with the moon and stars. It was all one and the same. She had known it and belonged to it. Stanford wanted her, he wanted some answers, and she was key to the mystery. He felt the nipple between his lips, sucked and licked it like a child. Her burning groin was pressed against his erection, moving back and forth,

teasing. Stanford pressed her sweaty spine. He slid his hands down to her buttocks. He removed his lips from her right breast, slid his tongue across her skin, then took the other nipple in his mouth and let it roll through his teeth. The girl gasped and writhed against him, both her hands at his neck. She ground her belly against his throbbing erection and pulled him closer. Stanford pushed her against the table, jerked the dress down her arms; she moved her arms and let the dress fall to her waist, her body sweat-slicked and white. Stanford sucked her breasts and nipples, soaked his lips with her sweat. The girl gasped and placed her hands on his neck and sunk her nails in his skin. Stanford felt her ridged spine, slid his hands up to her shoulders. The girl groaned and fell back and pulled him down, her thighs opening out to him. Stanford knew that he was lost. He spiralled down through a void. The girl was bent back against the creaking table, and he glimpsed the oil lamp. Its light flickered in a darkness. Beyond the darkness there was nothing. The girl opened her thighs and clamped them tight around his hips, and Stanford pushed his erection against her belly, his hands gripping her buttocks. He didn't think of what he was doing: her writhing form was his whole being. He had lived with her memory for three years and now her touch stripped his senses. He squeezed her buttocks and pressed upon her, kissed her breasts and nipples, slid lower and put his tongue into her navel, his lips sucking the creamy skin. Flickering shadows and light. A moaning wind in the distance. The girl lay back on the table, her thighs clamped around his hips, and he saw the dress tangled around her waist as his tongue licked her belly.

'Yes,' Stanford groaned. '*Yes*!'

The girl reached up for his jacket, pulled it down around his arms, and he slipped his hands from under her naked spine to let the jacket fall off. The girl gasped and grabbed his shirt, her fingers tugging at the buttons, her legs coiling around him, her buttocks pressed against the table's sharp edge, her groin thrusting up into him. Stanford glimpsed the burning lamp, flecks of light in brown eyes, the eyes wild and blind, the pink tongue at her lips, dark hair lying across her tanned face, beads of sweat on her forehead. He groaned and ripped his shirt off. Her hands slithered along his chest. He saw the smooth skin of her throat, the marble shoulders, the heavy breasts, very white, the nipples dark and stiff, the dress around the slim waist.

The girl writhed and grabbed his belt, undid the buttons on his pants. He saw her parted legs, the golden down of her inner thighs, her dress split

above the crotch and falling away from a red patch of panties. He groaned and unzipped his pants, spread his fingers on her belly, very smooth, soft and warm, felt the mound of damp hair, closed his fingers and slid them under her panties as she groped in his pants. Stanford groaned and muttered something. The girl gasped and shook her head. Stanford slid his fingers through the mound of hair, curled them back, felt inside her. The girl gasped and thrust down, her thighs opening and closing, then she tore at his pants and jerked them open and took hold of his cock. He groaned and felt inside her, the moist warmth, the yielding lips, found her clitoris as she pulled his cock out, her fingers closing around it. Stanford felt her sliding fingers, lost himself, *became* her fingers, thrust himself into the soft glove of her hand, his fingers kneading her clitoris.

The oil lamp cast light on the table. Around the lamp there was only darkness. Stanford groaned and dissolved, flowing out into that darkness, becoming one with the darkness and the silence that was torn by her gasping. The girl pulled his foreskin back. Her fingers slid up and down him. He drained out of himself, flowed away and knew only her silky touch. Stanford felt deep inside her. She was wet and warm in there. He jerked his fingers out and tore her panties off, the ripping sound jolting through him. The girl gasped and shook her head, rocking wildly from side to side, her thighs clamped around his hips, her fingers tight around his cock, around his hardness, trying to guide him into her, his tip rubbing her clitoris. Stanford groaned and shuddered violently, grasped her buttocks, squeezed and pulled; the girl pushed herself against him, opened for him, drank him in, became part of him.

‘Yes!’ Stanford hissed. ‘*Yes*!’

He sank down and brought her with him, his hands clutching her buttocks, kneeling low, letting her slip off the table, her thighs opening wider. Stanford grabbed her by the shoulders, pulled her down hard on his cock; the girl gasped and slipped her hands beneath his arms and then clawed at his ribs. Stanford pushed her shoulders back. Her spine was bent in a flowing line. Her breasts were pointing at the ceiling, her brown thighs locked around him, her legs bent back, her feet touching the floor, his cock still deep inside her. Stanford held her sweaty spine. His other hand caressed her breasts. He groaned and lowered her to the floor and then pressed down upon her. She shook her head from side to side, her eyes closed, her mouth open. Her dishevelled hair was coiled across her nose and

lips, curled around her pink tongue. Stanford stretched out along her. She opened her thighs and writhed beneath him. She pulled her legs up, her knees level with his shoulders, then slid her hands across his buttocks and squeezed him, hoping to coax him in deeper. Stanford groaned and rolled his hips. He felt her melting around his cock. She was liquid and his cock dissolved within her and he felt himself burning. He spasmed and changed direction, moving from one side to the other. He thrust deeper inside her, touched her center, set her loose, and she gasped and banged her head on the floor and started shuddering under him.

'Oh, God!' she gasped. '*God*!'

The words exploded over Stanford, ricocheted, filled his head, jerking him brutally back into himself and making him open his eyes. He saw the girl's bouncing head, her closed eyes, her open mouth, strands of dark hair lying across her strained face, beads of sweat on her forehead. Stanford stared at her, startled. He raised himself up on his hands. He saw the smooth line of her shoulders, the stretched tendons in her neck, thrusting breasts, nipples dark and erect, his own sweat on her belly. Stanford looked along her body, saw his own heaving groin, her thighs parted, his groining pumping up and down, his cock thrusting, withdrawing. He was shocked, but couldn't stop, felt a mounting excitement. He ceased moving and the girl's body shuddered and then pushed up into him.

'Who were they?' he asked. 'You can talk. You can tell me. You hear me? I want to know who they were.'

'No!' she cried. '*God*!'

Stanford held himself off her. He was propped up on his hands. He looked down at her sweat-slicked, writhing body and then trust deep inside her. The girl gasped and clenched her fists, banged the fists on the floor. Stanford flattened her breasts with his chest and grabbed her under the shoulders. He pulled her tighter to him. She groaned and thrust down. Starting to lose control, he slid his hands beneath her buttocks, along the underside of her thighs, then pushed her knees back toward her face and raised her hips and thrust deeply. Stanford's head started spinning. He thrust in and out in long, languid motions, his buttocks constricting. Stanford thrust even harder, heard the liquid sounds of sex, felt her heat, that jellied warmth around his cock, her spasms building and shaking him.

'*Who were they*?' he whispered.

Stanford worked himself up onto his knees and grabbed the girl by the hips.

She was stretched out below him. He pulled her buttocks off the floor. He slid his hands along the soft down of her thighs and then pulled her tight to him. The girl gasped and shook in spasms. Her body flowed away from him. She was twisting on the floor, rocking wildly, her legs over his shoulders Stanford pulled her even closer, thrust fiercely inside her. He saw the lights in the sky, the butchered cattle in the field, all the friends who had died or disappeared, the miraculous UFOs. He had to crack the mystery. The truth must have dominion. He grabbed the girl by the hips and pulled her closer, thrusting in to him limit. He touched her. She broke loose. Stanford pushed his hips forward. The girl cried out as the spasms whipped through her and tore her apart. She started coming, wave piled upon wave, her body writhing and shuddering.

'Oh, my God!' she cried. '*They were Germans*!'

The last word cut through Stanford, exploded, made his head spin, and he shuddered, they both shuddered together, while the room spun around him. They let it go and rolled apart, lay on their backs, breathing heavily, separated by a pool of flickering light, both half hidden in shadow. Stanford stared up at the ceiling. The walls were spinning around him. He licked his lips and let the spasms pass away and then he looked at the girl. She was lying on her side. Her hair fell across her face. The upper portion of her body was white, but her legs were a dark brown. She lay just outside the light. Her eyes were hidden by her hair. She was breathing in deep, painful spasms, her breasts rising and falling. Stanford stared at her, speechless. He knew he had to ask her more. Then he felt a wave of hatred flowing toward him as the floor started shaking.

'*Jesus Christ*!' Stanford whispered.

The room roared and seemed to shake, the crockery rattling on the shelves, and Stanford felt a sudden fierce wave of heat and was blinded by white light. He thought he heard the girl screaming, blinked his eyes and saw stars, heard her screaming in a terrible manner and rolled over toward her. The floor was definitely shaking. Cups and saucers were breaking. The glass in the windows blew apart and flew all over the room. Then the roaring stopped abruptly. The wave of heat passed away. Stanford opened his eyes and looked at the girl and saw her clutching her head. She was shaking her head from side to side. She wasn't screaming anymore. She took her hands from her head and stared at him and the hatred flowed out of her.

Stanford drew away from her. He didn't think – he just did it. Her brown eyes were extremely bright and intense, illuminated by hatred. The floor growled and then stopped shaking. The girl jumped to her feet. Stanford jumped up behind her as she grabbed at a kitchen knife, picked it up, turned around and started slashing the air with it. Stanford ducked and jumped back. 'Get out!' the girl shrieked. She rushed at him, the knife raised high and glittering, and swung it down toward his face. Stanford grabbed hold of her wrist. The girl hissed like a cat. The knife clattered to the floor and she clawed at him with her free hand, her nails raking down his right cheek and gouging lines in his face. Stanford felt the warm blood, felt the pain, a chilling fear; he slapped the girl with the back of his hand and pushed her onto the table. The girl hissed and grabbed the oil lamp. 'Get out of here!' she screamed. She threw the lamp and it flew past Stanford's head and crashed into the wall. A crackling roar, a wave of heat. The burning oil poured down the wall. Stanford cursed and swung his fist at the girl and knocked her into the wall. The flames raced across the floor. Stanford had to leap away. The girl hissed and then darted for the door, flung it open, rushed outside.

Stanford choked in the swirling smoke. The flames were racing along the walls. Stanford cursed and then escaped through the doorway and saw the stars in the sky. Then the darkness exploded, became a sheet of fierce white light, blotting out the sky and flatlands and temporarily blinding him. Stanford stopped and then staggered backward, put his arm across his eyes, moved his arm away and squinted through his fingers, trying to see through the dazzling light. He couldn't see, but he could hear. There was a steady, bass humming sound. Stanford heard it and felt it – it was drilling through his skull – and he reached up and clutched at his head and then stepped forward blindly.

He missed the steps and fell down, struck the ground with his right shoulder, heard it snapping and felt a sharp pain that made him cry out. He rolled onto his back, spitting dirt, looking up, saw the brilliant striations of white light and closed his eyes again. The ground shook beneath him. His head was tightening and hurting. The sound was drilling through his skull, making his muscles seize up, and he shuddered, his body out of control, and then dropped down through darkness.

A light bored through the darkness, spread out and filled his vision. He opened his eyes and looked up and saw the dazzling white light. This time

he could look at it. He tried to rise, but couldn't move. He heard the roaring of flames and turned his head and saw the whole ranch house blazing. Then he heard a noise behind him. He turned his head in the opposite direction. He saw a fierce white haze with brighter lights inside it, the lights forming a lone line. Then he saw the silhouettes. They formed a semicircle around him. They moved closer and he saw the ragged girl, looking down at him, smiling. The girls eyes were large and vacant. She was sucking her thumb. One of the silhouettes moved over to Stanford and knelt down beside him. The man was wearing a gray coverall that looked silvery in the bright light; his face was deathly pale and unnaturally smooth, smiling slightly, removed. Stanford couldn't see him clearly. The man appeared to be quite small. He moved his head and the shadows disappeared and Stanford saw him more clearly. He wasn't an adult. He was about fourteen years old. He reached out and touched the side of Stanford's neck and Stanford felt very calm.

'You shouldn't have come here,' the boy said, his voice deeper than it should have been. 'We don't know what to do about you, Dr Stanford, because you shouldn't be here. We know all about you. We're not pleased with what you're doing. We are computing but we don't know what to do, because you shouldn't be here. We'll have to leave you for now. We have received no instructions. We will leave you and then, when we are gone, you will be able to walk again. You shouldn't be here, Dr Stanford. We were not informed of this. We will leave you because we have no instructions and we cannot compute you. Close your eyes, Dr Stanford. That's right, keep them closed. When we leave, you will open them again and be able to walk. Keep your eyes closed. *Auf Wiedersehen*.'

Stanford kept his eyes closed. He hardly knew he had closed them. There was silence and his head felt very light and he felt very calm. He heard the footsteps moving away. A film of dust fell on his face. He felt the earth beneath his back, extremely cold, eating through to his bones. Then he heard a bass humming sound. Something thumped the ground lightly. He heard shuffling, a hollow, metallic drumming, then the silence returned. Stanford lay there, not moving. He kept his eyes closed, feeling calm. He smelled smoke and heard the crackling of the flames that engulfed the ranch house. Then the ground started shaking. Stanford felt the vibrating noise. The vibrating noise grew stronger, seemed to fill his whole head, then it cut out, became a rhythmic humming that spread out just above him. The

ground settled down again. Stanford lay there, feeling calm. The humming noise became fainter, climbed away and then cut out, leaving silence, the whispering of the dust, the wind's dull, lonesome moaning.
Stanford opened his eyes. He looked up at the moon and stars. He shook his head and clambered awkwardly to his feet and looked carefully around him. The whole ranch house was on fire. The flames spat at the sky. Stanford stood there, feeling dazed, gazing over the desolate flatlands, the flames crackling and illuminating the darkness, and thought of only one thing: the parting words of the boy.
Auf Wiedersehen.

Chapter Twenty-Six

Lying on the double bed in the lodge in Mount Rainier, Epstein dreamt of the lights in the sky, rising gracefully, silently. He tossed and turned in his sleep, felt desolate sense of loss, wanting to follow the ascending lights, to drift up there through the darkness, to share in their serene, graceful majesty, to unravel the mystery. Then the dream changed. Epstein murmured and groaned out loud. He was on the flight back from Paris, flying high above the clouds, listening to the voice on the tape-recorder, the revelations astounding him. Then, suddenly, the whole airliner shook, rolling over, scattering passengers, a dazzling white light pouring through it, temporarily blinding him. Epstein shaded his eyes, ignored the screaming, tumbling passengers. The airliner leveled out again and he looked through the window and saw a flashing mass just above, gliding over the plane. It was the great mother ship, the one he had seen in the Caribbean, and Epstein watched as it came down on the airliner and then somehow swallowed it… In his sleep he tossed and turned. He looked down upon himself. He saw himself lying there on the bed, his eyes opening, frightened. He was surrounded by a group of men. They all appeared to be very small. They were wearing gray coveralls, they didn't say a word, and then one of them leaned over him and reached out and touched him… Epstein groaned aloud. He returned to the streets of Paris. He was seated in a restaurant in the rue de Rivoli, the old man talking into the tape-recorder, sipping cognac methodically. The old man was English. There was dandruff on his shoulders. He talked slowly, but with studied precision, and Epstein drifted away… He was just back from Paris, changing planes at Kennedy

Airport. There were people all around him, rushing to and fro, shouting, and he felt inexplicably frightened to be there, though he didn't know why… Then he was on another plane. The flight to Washington was uneventful. He glanced down at the clouds, a field of clouds, shifting slowly, and he checked the cassette tapes in his pocket because the fear was still with him… Epstein groaned in his sleep. He tossed and turned on the bed. He was in his office in Washington, DC, putting the tapes in his safe, obsessed with the notion that he was being followed, that someone was watching him. The office was deadly quiet. The ceiling lights stung his eyes. He heard the traffic along Massachusetts Avenue, still there even at midnight. Epstein locked the safe. He read the message from Stanford: his young friend was up in Mount Rainier, checking some recent sightings. Epstein felt tired and scared. The night faded into noon. He was in his car, driving up the mountains, the fear making him sweat… Epstein groaned and muttered something. He tossed and turned in his sleep. The lodge was empty and he found another message and lay down with his deepening fear. The fear increased and became unreal. Epstein opened his eyes. He saw the small men standing all around his bed, very quiet, looking down at him. Epstein felt a chill pass through him. They weren't men: they were boys. Then one of them, about fourteen years old, leaned over and touched him…

Epstein groaned and woke up, feeling cold and deeply frightened, thinking only of the cassette tapes in the safe and of what they might mean. He licked his lips and rubbed his eyes, saw the wooden beams above him, the room no longer dark, the lights on, a chair creaking beside him. He turned his head, expecting to see Stanford, but the man sitting in the chair was a stranger. Epstein sat up on the bed and rubbed his eyes and tried to stay calm.

The man was slim and sophisticated, wearing a black shirt and slacks, his eyes sky-blue and intense, his hair silvery and plentiful, parted neatly on the left and falling down over an uncommonly unlined forehead. He sat casually in the chair, his hands folded on his crossed legs, gazing straight at Epstein and smiling, a cold, remote smile.

'Who are you?' Epstein asked.
'Wilson,' the man replied. 'You might remember me. Richard

Watson mentioned my name. Is was there in the transcripts.' 'How did you know about the transcripts?'
'Richard told me,' the man said. 'We let him go and then we

brought him back and he told us everything.'

The fear shivered down Epstein's spine, made him numb, slightly unreal, and he rubbed his eyes and tried to waken up, still tired from his flights. The man was looking steadily at him. There was something odd about him. He seemed to be in his early fifties, a handsome man, extremely youthful, but the skin on his forehead was unlined, his cheeks as smooth as a boy's.

'You remember the transcripts?' he asked.
'Yes,' Epstein said.
'Then you should remember me,' the man said. 'I'm Wilson. I was

present.'

Epstein shook his head, clearing it, feeling disorientated, not sure that this was actually happening, his fear slowly subsiding.
'You're Wilson?'
'That's right,' the man said. 'I know it must he something of a shock, but that won't last too long.' He smiled in that chilling manner, glanced casually around the room, then turned his gaze back upon Epstein, his blue eyes still bright. 'Stanford's on his way back,' he said. 'He's been up in the mountains. He's been checking on some UFO reports, but he hasn't found much.'
'How do you know? Epstein asked.
'We've been watching him,' Wilson said. 'It was *my* flying saucers that were seen – and they're up there right now.'
Epstein felt cold. He wondered if he was dreaming. After pinching his left wrist he knew he wasn't, and he shivered a little.
'*Your* flying saucers?'
'That's right,' Wilson said. 'Don't look so shocked. They're very real… and they're up there right now.'
'Where?' Epstein asked.
'Above the atmosphere,' Wilson said.
'Then our reconnaissance satellites will see them.'

‘Indeed. They’ve been seeing them for years.’
Epstein wondered what he meant by that, wanted to ask but couldn’t do it, still dazed from being jerked out of sleep, a throbbing pain in his stomach. He coughed and rubbed his tired eyes. The room seemed far too bright.
Wilson uncrossed his legs, propped his elbows on his knees, then rested his chin in his cupped hands, studying Epstein intently.
‘How are you?’ he asked.
‘What do you mean?’ Epstein said.
‘Your stomach,’ Wilson said. ‘Is it hurting? It must surely bother you a lot.’
‘How do you know about my stomach?’
‘Cancer’s a very bad thing,’ Wilson said. ‘I myself have suffered ailments in the past, but all that’s behind me now.’
‘Behind you?’
‘Yes, behind me. I used to have bad trouble with my heart, but I’ve managed to mend it.’
‘What are you talking about?’ Epstein asked. ‘I don’t understand. What are you doing here in my room? Who let you in?’
‘I have a pacemaker,’ Wilson said. ‘A very sophisticated device. It utilizes a piezoelectric crystal, a small balloon filled with water, and causes the heart’s own pumping to stimulate itself. It is, of course, maintenance free. It does not require batteries. The miracles of science, Dr Epstein, are literally boundless.’
‘Plastic surgery,’ Epstein said.
‘I beg your pardon?’
‘I was looking at the skin on your forehead. You’ve had plastic surgery.’
Wilson smiled and nodded. ‘Most perceptive of you,’ he said. ‘Plastic surgery, pacemaker, various organs replaced… Unfortunately I was one of the first. We’re much more advanced now.’
‘Who’s we?’ Epstain asked.
‘My own people,’ Wilson said. ‘We’re far removed from what you know, but that, too, can be remedied.’
Feeling that he was dreaming, Epstein blinked and glanced around the bright room and then turned back to Wilson.
‘Who are you?’ he asked.
‘I created the flying saucers,’ Wilson said. ‘You’ve been trying to solve the mystery for twenty years and now I’m here to assist you.’
Epstein wanted to bang his head against the wall in the hope of waking up

properly, but he didn't do anything. This all seemed too crazy.
'*You* created the saucers?'
'Yes,' Wilson said. 'They exist, they're right here on Earth, and I'm the man who created them.'
'For the Air Force?'
'No.'
'For the Navy?'
'No.'
'I don't understand. I'm confused. I'm very tired. Who are you and what do you want with me? What are you doing here?'
'You don't believe me,' Wilson said.
'Of course not,' Epstein said.
'I won't tell you where I've come from,' Wilson said, 'but I'm taking you back there.'
The fear slithered down Epstein's spine. He could hardly believe that this was happening. He thought of Stanford and Scaduto, of his own trip to Paris, of the questions that sprang up and collided as the facts were revealed. He would have to keep his mouth shut. He would have to watch his man carefully. This man knew an awful lot about him and that couldn't be good. He thought of the tapes in his safe. This man knew about the tapes. This man must be from the government or the FBI or the CIA; he already knew about the tapes and wanted to steal them and shut Epstein's mouth. Epstein was truly frightened now. He didn't know what to believe. He stared at the man sitting in the chair and felt threatened by him.
'You're from the government,' Epstein said.
'No,' Wilson said. 'The government saucers are relatively primitive. My saucers are the ones you're been looking for.'
'I don't believe you,' Epstein said.
'I was in the Caribbean.'
'The Caribbean?'
'St Thomas,' Wilson said. 'It was my saucer that abducted Professor Gerhardt. You saw it. You and Stanford were on the beach.'
Epstein's fear deepened considerably, made him suck his breath in, now starting to believe the man in the chair, having no other choice. He let his breath out when speaking.
'You took Gerhardt?' he asked.
'Yes,' Wilson said.

‘Where do you come from?’ Epstein asked. ‘How do you know about me? I can’t really accept what I’m hearing. This just doesn’t make sense.’
‘I built the saucers,’ Wilson said. ‘You’ve just found out how they started. You have that information down on tape. I want you *and* the tapes.’
Epstein licked his dry lips. He felt very badly shaken. Wilson’s eyes were sky- blue, almost steely with intelligence; he leaned forward and looked directly at Epstein, speaking softly and clearly.
‘We know all about you,’ he said. ‘We’ve been watching you for years. You’re a very tenacious man, you don’t stop, and now you’re dying of cancer. That makes you even more dangerous. You’ll be even more determined. We think you’ve found out too much already, so it has to end now.’
‘I’ve found nothing out,’ Epstein said.
‘You’re lying,’ Wilson said. ‘You’ve just returned from Paris where you were seeing Professor Ronald Mansfield, an Englishman who worked for the scientific division of the British Objectives SubCommittee during World War Two and who is currently working for the *Groupment d’Etudes des Phénomènes Aériens*. That disturbed us, Dr Epstein. That’s as far as you can go. We want you and the tapes you brought back, which is why I am here.’
Feeling fearful, Epstein also felt paralyzed, removed from himself, not convinced this was really taking place.
‘You want me?’
‘That’s correct,’ Wilson said. ‘You will not see the dawn over Mount Rainier. You’re coming with us.’
Epstein didn’t know what to say. He wished that Stanford would return. This conversation was bizarre, not quite real, and he felt very strange.
‘I don’t have the tapes,’ he said.
‘Where are they?’ Wilson asked.
‘I didn’t tape the conversations,’ Epstein lied. ‘We just talked. He knew nothing.’
‘You’re lying again, Dr Epstein. I understand, but it’s pointless. We’ll just take you away tonight and then ask you – and believe me, you’ll tell us.’
‘What about Professor Mansfield?’
‘He hung himself yesterday.’
‘You mean you murdered him.’
‘That’s a very emotive word,’ Wilson said. ‘We simply did what we had to do.’

‘And what happened to Richard Watson?’
‘An interesting case. He had unusually strong resistance, great willpower, so we wanted him back with us.’
‘You’ve got him now?’
‘Yes. We were surprised at how much he told you. We implanted an electrode in his brain and he *still* showed resistance.’
‘He’s alive?’
‘He’s functioning. We’ll send him back soon. He’ll then do what we tell him to do – and he won’t be alone.’
‘Who’s we?’ Epstein asked.
‘I can’t tell you that right now.’
‘And is that what you do? You abduct them and robotize them. Then you send them back into the world and make them follow your orders?’
‘That’s right,’ Wilson said. ‘It’s not as incredible as it sounds. Bear in mind that such work has been going on for years – in America, in Russia, in Europe – and it’s highly advanced. Your people don’t understand this, they don’t know what’s really happening; they only hear about *acceptable* experiments – they don’t know the full extent of it. Electrocontrol is a fast-growing industry, being expanded behind closed doors. In your own society it’s relatively well advanced; in ours, much more so. Our own subjects begin in infancy – we take them out of the cradle. We implant electrodes in their brains, and at certain points in the spinal column, before they’ve even reached their fourth week. After that, they belong to us. They’re developed in extraordinary ways. They’re programmed for obedience, their capabilities are enhanced, and they never know the pain of discontentment.’
Epstein closed his eyes. ‘The young boys,’ he murmured.
‘Ah, yes,’ Wilson said. ‘Stanford saw them. That must have confused him.’
Epstein opened his eyes again. ‘And Richard Watson?’ he asked.
‘It’s different with outsiders. Their advanced age makes all the difference. With outsiders we have to be more careful – and aren’t always successful. Richard Watson was such a case. Strong willpower, great resistance. We’ve inserted another electrode in his skull and now he seems to be functioning.’
Epstein glanced around the room, feeling dreamy, almost haunted; he glanced out through the windows, at the darkness, heard the wind on the mountains. Stanford was out there. He was looking for UFOs. The irony of it made Epstein smiled, but then the fear trickled back again. He looked at the man called Wilson. The blue eyes were very bright. Epstein studied the

smooth skin on his forehead and felt extremely uncomfortable.
‘I don’t believe this,’ he said.
‘What don’t you believe?’
‘I don’t believe a damned thing you say. I think it’s some kind of trick.’
Wilson offered his chilling smile. ‘You’ll believe soon enough,’ he said. ‘You’ve been wrestling with the mystery for twenty-odd years… Your reward comes tonight.’
‘What do you mean?’ Epstein asked.
‘We’re taking you away,’ Wilson said. ‘It doesn’t matter where you go, where you hide… We’ll just come down and pick you up.’
‘You’re not taking me now?’
‘It’s not convenient,’ Wilson said.
‘And what happens if I don’t leave this room?’
‘We’ll just open the door. This door or any other door that you’re hoping to hide behind.’ Wilson smiled and stood up, went to the window and stared out, turned back and looked down at Epstein, his blue eyes bright and cold. ‘You were in the Caribbean,’ he said. ‘You know what happened there. If we want someone, we just come and take them – and nothing can stop us.’
Epstein thought back on the Caribbean and remembered the howling wind, the hotel room going crazy, the dazzling light and intense heat; he recalled Stanford’s experience at the ranch in Texas about five months ago. White light and heat, fierce storms and shaking buildings; the manifestations were always the same, the causes unknown.
‘Did you cause the storms?’ he asked.
‘Yes,’ Wilson said. ‘Advanced weather engineering. Something similar to your own cloud-busters, but more sophisticated. Our own cloud-busters are laser-based and highly effective. The larger saucers can whip the wind up – or disperse it, if necessary.’
‘I don’t believe this,’ Epstein said.
‘Why not?’ Wilson said. ‘Cloud seeding is an established science. Orgone energy weather engineering is becoming more advanced every day, with floods and droughts engineered for political or military purposes. Of *course* we can cause a storm – so can the Russians and the Americans. Weather engineering is no longer a mystery – it’s an effective new weapon.’
‘And the cattle?’ Epstein asked.
‘For our laboratories,’ Wilson said. ‘For various drugs and vitamins and advanced medical research. Again, there’s nothing outlandish about it… a

simple question of theft.'
'And the people? The kidnapped people?'
'Like the cattle,' Wilson said. 'Some are used as slave labor, some are robotized and returned, some are sent to the medical laboratories as guinea pigs for our research.'
'That's horrible,' Epstein said.
'The word "horrible" is redundant. The spider eats the fly and in turn is devoured; all that lives in the present supports the future and has no other purpose. Nothing is horrible, Dr Epstein. As a scientist you should know that. Blood and suffering is the constant of the laboratory
– and is vital to progress.'
'We're talking about human beings.'
'Indeed we are,' Wilson said. 'And human beings are no more than the rungs on evolution's great ladder. Science is all, Dr Epstein. The mysteries of life must be uncovered. Science can't progress as it should if it's held back by sentiment. Humans live and die anyway; they do so to no purpose. Only science can stop this primitive wastage and make people useful. Free choice leads to conflict and wastage, and is harmful to progress. Emotion is wasted energy. Moral judgements hold back science. There are too many people, there is too much human wastage, and we have to accept that human life is just cement for the future. To merely exist is not enough: what we need is a new *form* of being. We must learn how to take the human being apart and reconstruct him as something else. A superior being. A creature devoid of contradictions. And the gulf between Man and Superman can't be bridged with emotions.'
'That's still horrible,' Epstein said.
'You're still a primitive,' Wilson said. 'Where you're going, you will not feel the same: you will come to accept it.'
'Where *am* I going?'
'You'll find that out soon enough.'
'I don't believe this,' Epstein said. 'I *can't* believe it. It just doesn't seem real.'
'Time will tell,' Wilson said.
Epstein closed his eyes again. He felt weak and light-headed. In the darkness behind his closed eyes he saw the void of the cosmos. Not a void: something else. The voids of space were filled with energy. Beyond the galaxies, in what seemed like a void, possibilities were boundless. Where

would Man go? What would he become? Epstein opened his eyes and tried to accept what it was he was hearing. He had searched for twenty-odd years, had lived constantly with the mystery, and now, face to face with the answers, his fear overwhelmed him.
'The flying saucers are real,' he said.
'You know that,' Wilson said. 'What you heard in Paris must have convinced you, so the question's superfluous.'
'What are they?' Epstein asked.
'You already have the basic facts. We've progressed enormously since then, but the basics remain. At present, apart from the systems that Mansfield doubtless told you about, we utilize advanced ion propulsion, electromagnetic propulsion, in certain cases nuclear fusion pulse rockets, and, for the giant saucers, the carrying ships, an antigravity field. Ionization and electromagnetic discharges account for the plasmalike glow that so fascinates your witnesses, the antigravity accounts for the lack of turbulence and sonic booms; and you and Stanford have already discussed – with reasonable accuracy – the cause of the abrupt invisibility.'
'How did you know that?' Epstein asked.
'We bugged your rooms,' Wilson said. 'Nothing is new under the sun – we've simply made advances.'
'And the antigravity shield accounts for your crews' apparent ability to withstand the extraordinary speed and direction changes of your saucers?'
'Precisely. The gravity-shield force applies simultaneously to the crew *and* the saucer… And, since it provides a cushion of air around the saucer, it also prevents the saucer from heating up. Incidentally, I should point out, since you're looking so disbelieving, that antigravity is not as revolutionary as it seems. Indeed, as far back as 1965 there were at least forty-odd *unclassified* G-projects being undertaken in America alone – by the Air Force, the Navy, the Army, NASA, the Atomic Energy Commission and the National Science Foundation. Since these were the *unclassified* projects, I need only point out that considerably more advanced projects are doubtless underway right now in strict secrecy.'
'Are you suggesting that you're connected to the US government?'
'No, I'm not saying that.'
Epstein couldn't think straight. He stared at Wilson, at the icy blue of his eyes, then he remembered Dr Campbell, what he had related about hypnosis, and, remembering this, thought that he should try to get off the

bed… But Wilson spoke and that stopped him.
‘It’s all right,’ Wilson said.
‘Yes,’ Epstein said, no longer worried, simply wanting to know more. ‘We keep receiving reports of different-sized UFOs, and that always confuses us…’
‘The smallest saucers are similar to your own CAMS – Cybernetic Anthropomorphous Machine Systems, either remote-controlled or programmed to react to certain stimuli, used mainly as sensing devices or probes. Taking the Richard Watson case, the beam of light that shone into the car was merely a laser beam on a wavelength that freezes skeletal muscles or certain nerves – thus producing either temporary paralysis or a trancelike condition.’
‘And the other saucers?’
‘The first group are anything from five to fifteen feet in diameter. Again, these are highly complex CAMS, either flying with their long axis vertical or flying in the direction of their axis, used mainly for reconnaissance and basic manual tasks, such as the collecting of soil or water, and controlled by Remote Manipulator Systems not much different from normal ones. The second group, usually about twentyfive to thirty-five feet in diameter, are extensions of the first group, but revolving around their axis and controlled by extremely advanced cyborg crew members. The pilot that Richard Watson saw in the second saucer was just such a cyborg: half man, half machine – the results of over thirty years of prosthetic experiment. The cyborg’s respiration and other bodily functions are controlled cybernetically with artificial lungs and sensors that maintain constant temperature, metabolism and pressure, irrespective of external environmental fluctuations – thus they aren’t affected by the extraordinary accelerations and abrupt direction changes of their saucers. The third group of saucers can range from one hundred to three hundred feet in diameter, can be up to several stories tall internally, are used mainly to pick up people and animals and material goods, and have a crew of about a dozen men. The fourth category is the carrying ship – what you people call the “mother” ship – a somewhat gigantic affair, used for major operations of a long-term nature. The carrying ships are essentially self-generating airborne colonies, capable of drifting in outer space or of hibernating on the sea bed, manned by a large crew of humans and cyborgs, the heavy labor performed by programmed slaves, and containing workshops, laboratories, medical

wards, cryonic preservation units, and hangars for all the other, smaller saucers.'
Wilson smiled as he talked to Epstein, a distant, cool smile, his lips dutifully performing the necessary while his eyes remained hard. His eyes fascinated Epstein, repelled him and drew him in, unblinking, as clear as sunlit ice, making Epstein feel unreal. And yet the man sounded reasonable, talking quietly, precisely, explaining with the patience of a teacher, making everything simple.
'You must be highly advanced,' Epstein said.
'Yes,' Wilson said, 'we are. Our society is based on masters and slaves – and exists just for science.'
'Where is it?' Epstein asked.
'Just be patient,' Wilson said.
'Please tell me now. I want to know.'
'You'll find out soon enough.'
They stared at one another, the silence broken by the wind outside, the light in the room extremely bright, the window framing the dark night.
'You said that the carrying ships can hibernate on the sea bed,' Epstein said eventually. 'Is there a connection between that fact and the mystery of the Bermuda Triangle and other areas reported to be like it?'
'Yes,' Wilson said. 'We have permanent undersea laboratories in the Bermuda Triangle, the so-called Devil's Sea between Guam, Luzon in the Philippines, and the southeast coast of Japan, and another off the coast of Argentina. These laboratories are manned by cyborgs and a few programmed scientists, and are visited frequently by the carrying ships.'
'And it's your carrying ships that cause the unusual magnetic disturbances in those areas?'
'Yes.'
'I can't accept that you could construct such undersea laboratories without being seen by *someone*… By the crews of passing ships or aircraft.'
'Various governments know we're down there, and in fact cooperate with us. As for the actual construction of the laboratories at such depths, you have to appreciate the unusual dimensions and capabilities of the carrying ships. For a start, their interior space is immense. The carrying ship simply settles near the sea bed and the laboratory is constructed inside it. The base of the carrying ship then opens up and deposits the laboratory, complete with crew, on the sea bed. The permanent fixing of the laboratory to the sea

bed is accomplished with the aid of specially reinforced, remote-controlled CAMS, and then the carrying ship ascends to the surface, leaving the laboratory down there.'
'And various governments *know* you're down there?'
'Yes.'
'But you don't belong to any of those governments?'
'No.'
'Will you explain that?'
'Not yet.'
Wilson smiled bleakly and turned back to the window, looked out as if searching for someone, then glanced up at the night sky.
'Our reconnaissance satellites,' Epstein said. 'Is it true that they've seen you?'
'Yes,' Wilson said, turning back to the front. 'Naturally. How could they miss us? They've been seeing us for years.'
'Then they've been covering up for years.'
'Of course,' Wilson said. 'There's nothing particularly unusual about that – they've been covering up everything.'
'I don't know what you mean.'
'Don't you? What about all their secret research programs: their chemical warfare programs, their advanced weaponry programs, their secret achievements in aeronautics and communications and neurology; their covert operations against, and their clandestine agreements with, the Soviets and the Chinese and the Third World countries? The private citizen know precious little. He knows only what they deign to tell him. Governments cover up everything, from their politics to science, and when it comes to something as big as our saucers, they cover up even more.'
'Why?' Epstein asked.
'Because they don't trust the people. Because there isn't a government in the world that still believes in Democracy.'
'What's your connection to them?'
'I can't tell you that,' Wilson said.
'You're not an extraterrestrial,' Epstein said. 'That much I know.'
When Wilson offered a faint, possibly victorious smile, Epstein flushed like a guilty schoolboy, thinking of the cassette tapes in his safe, knowing that Wilson had tricked him.
'Ah, yes,' Wilson said. 'Professor Mansfield. He must have told you a lot.'

Epstein burned and then cooled down, his throbbing stomach now at peace, feeling bright to the point of unreality, removed from his woes. He wondered where Stanford was, wished that Stanford would return. The wind moaned outside, sweeping over the darkened mountains, and he thought of the UFO sightings over the Cascades, of what Scaduto had told them. The truth emerged in small pieces. It lay before him like a jigsaw. There were still missing pieces, gaping holes, and the clock ticked the time away.

'The harassment,' Epstein said. 'The suicides and disappearances. I take it that they're part of the cover-up and that you engineered them.'

'Some of them,' Wilson said. 'It depends on the circumstances. The actual harassment was usually arranged by your government, but most of the deaths and disappearances were due to us.'

'Most?'

'Not all. Occasionally your government steps in and does a job on its own.'

'Then they work with you,' Epstein said.

'On and off,' Wilson said. 'As with all political situations, the agreements are tenuous and are prone to break down at any moment. We negotiate with the US government. We also negotiate with the Soviets. We trade and play one against the other because we haven't much choice yet.'

'Yet?'

Wilson smiled again. 'The Nuclear Deterrent, the Balance of Terror, is a precarious business.'

'And you're in the middle?'

'Yes,' Wilson said. 'We straddle the seesaw…But we'll soon tip the other two off.'

Epstein felt very calm now, divorced from himself, the pain in his stomach gone, the fear disappearing with it, the bizarre nature of the whole conversation making it seem unreal. He didn't know what to think, felt distant, almost placid, well aware that this man had done something to make him accept it all. The revelations were stunning, ambiguous, fascinating, and yet he now thought they sounded quite reasonable, down-to-earth, even commonplace. He wondered if he was hypnotized: stood outside himself and thought this. He saw that Wilson was now standing at the window, staring up at the night sky.

'You killed Irving,' Epstein said.

'Irving Jacobs?'

‘Yes. You killed him. Why did you do that?’
Wilson returned to his chair, sat down, stared at Epstein, not smiling his sky-blue eyes bright, filled with icy intelligence.
‘He was digging too deep,’ he said. ‘He’d found out too much. Your own government was disturbed by his findings and wanted us to get rid of him. They didn’t want to do it themselves. They didn’t dare use their own men. They didn’t want the FIB or the CIA to go anywhere near him. So, we worked on him. We had him followed and harassed. When he grew frightened, when his resistance was low, we used longrange telepathy. We stole part of his mind that way. We made him think he was possessed. In the end we made him drive out to the desert where we came down on top of him. We didn’t need him as a scientist – we have plenty in that field – so we simply stuck the pistol in his mouth and made it look like suicide.’
Epstein should have been shocked, but he felt nothing at all. He thought of Irving and Mary and the old days, but they seemed far away.
‘You use mental telepathy?’
‘Yes,’ Wilson said. ‘Certain brain implants can enhance telepathic powers and actually lead to nonverbal communication. Some of the children, and all of the cyborgs, communicate that way.’
‘Were you involved with the woman from Maine?’
‘Yes. We were experimenting and the woman from Maine picked us up and then told the CIA. The agent she first informed knew nothing about us *or* their own government’s saucers; but the Canadian government, when they heard about her, were naturally more concerned, thinking she might have picked up some Soviet signals. Bearing in mind that only a limited number of government and military personnel knew about the existence of the saucers, it was unfortunate that the agents who first interrogated the woman knew nothing about what was going on. However, at the second meeting, some of the military officers present knew all about the saucer programs – and it was they who subsequently buried the incident and transferred the CIA agents who were in the office at the same time, but didn’t know what was happening.’
‘Our informant said it was a Canadian-US saucer.’
‘An understandable error. Unfortunately, it was an error that led to your friend Scaduto spying on the Canadian plants. Mr Scaduto recently died of an unexpected heart attack. You can blame that on Stanford.’
The remark hardly affected Epstein. He felt calm and interested. The man

speaking sounded absolutely reasonable; the revelations seemed commonplace.
'What about Irving?' Epstein asked.
'I've already told you about him.'
'You didn't tell me what he'd found out. I'd like to know that.'
'Jacobs was interested in the deaths and disappearances of so many of his contemporaries, and this encouraged him to investigate the Jessup case. In doing so, he discovered that the US Navy had, back in 1943, been experimenting with pulsating and vortexual high intensity magnetic fields that might alter the molecular structure of physical properties and render them temporarily invisible. This experiment became known as the Philadelphia Experiment, but contrary to popular belief it was a disaster. What in fact happened was that the Navy inadvertently created a source of electromagnetic energy that produced an infrasound of such intensity it killed every sailor on board the ship and actually split the ship's hull. In short, the ship rumored to have disappeared actually sank – and naturally, since the Navy didn't want word of this to leak out, they whipped up a mass of rumors that acted as a cover-up and led to the contemporary myth… However, in investigating this incident, Dr Jessup learnt that the Navy's basic scientific principles were valid, that the Navy and Air Force were involved in saucer projects, and that those projects were utilizing certain aspects of the original Philadelphia Experiment. Having found out about this, Jessup had to be removed… Then Jacobs found out much the same thing and also had to be terminated.'
'I see,' Epstein said. 'And those principles were also the principles underlying the invisibility-inducing properties of your saucers?'
'Correct. A specific quantity of electromagnetic radiation creates a stream of escaping photons of the same wavelength and frequency, which leads either to a glowing, plasmalike shield or to a color source beyond the known spectrum that renders the saucer invisible.'
'How does this relate to the annotations in Jessup's book? The ones that stimulated the interest of the Office of Naval Research.'
'That was something of a red herring,' Wilson said. 'In 1955 the Navy was still experimenting with the possibilities of electromagnetically-induced invisibility. They were then, and remain today, unsuccessful. Nevertheless, they were disturbed by some of Jessup's published remarks – and the annotations in that copy of his book had been made by their own

intelligence officers, and related only to the sections that discussed force fields and dematerialization. The Navy wanted to know the source of his information, Jessup naturally refused to reveal it, then Jessup walked out of their office – and that's all there was to it.'
'You had nothing to do with the annotations?'
'No, not a thing.'
Epstein closed his eyes, let himself drifting away, drifting down through the darkness and the long years he had labored, feeling calm, then feeling confused and drifting back up again. He thought of the cassette tapes in his office, of the old man now dead, thought of everything the old man had told him, wondered what it might mean. He had to get the tapes to Stanford. If nothing else, he had to do that. He now knew that they would take him away, and that he would not resist. He didn't want to resist. His curiosity was too great. He opened his eyes and saw Wilson by the window and felt a great peace.
'I have to go now,' Wilson said. 'When I depart, you'll fall asleep. When you wake up, you'll do what you feel like – because the choice won't really be yours.'
'I'm confused,' Epstein said.
'By what?'
'You're not an extraterrestrial, you're from Earth, and you created the saucers. That's what confuses me. It just doesn't make sense. The first genuine UFO sightings were in 1897 – the Great Airship Scare – yet you say you're the man who created them.'
'That's correct,' Wilson said. He turned away from the window, walked back to the bed, and stood there, staring down at Epstein, his blue eyes exceptionally bright. 'I'm one hundred and seven years old,' he said. 'You, too, can live that long.'

Chapter Twenty-Seven

Approaching the lodge after his long day in the mountains, covered in snow and freezing, Stanford desperately wanted sleep, a respite from it all, an escape from the fear that now dogged him every day and was encouraged by his present state of exhaustion. The snow was deep and clean, drifting lazily upon itself, sweeping languidly around trees, the moonlight making it glisten, the wind moaning and scraping at his nerves, the mountains

looming above him. Stanford longed for the lodge, for its safety and warmth, but when he saw it, the fear increased greatly and make him stop walking.

All the lights inside were on. The front door was ajar. A beam of light fell from the doorway to the porch, illuminating the snow that drifted along the wood boards. Stanford stood beneath some pines, not moving, his heart pounding, wondering why the lights were on, who was in there, his head spinning with feverish thoughts. He knew he was being foolish, felt ashamed of it, couldn't stop it, recalling the boys in gray coveralls, the burning ranch and the vanished girl, remembering Gerhardt's abduction and Scaduto's recent suicide, and the fact that *they* knew who he was and might come back again…

Stanford cursed quietly and shivered, wiped snow from his face. He thought of the lights he had seen above the mountains, ascending vertically, abruptly shooting sideways. Not descending: *ascending*. Not meteors: *unidentifieds*. Stanford shivered and stared straight ahead, the panic emptying his mind, then he shook his head from side to side, realizing it was Epstein, cursed again, started walking again.

He climbed the wood steps, pushed the door open and entered. Glancing around the living area, seeing no sign of Epstein, he wondered why he had left all the lights on, then went into the bedroom. Epstein was sitting on the bed, wearing pajamas, looking sleepy, his hands folded primly in his lap, his gaze fixed straight ahead.
'You got my message?' Stanford asked.
'Yes,' Epstein replied.
'It's been a bitch of a day,' Stanford said. 'They've been all over

the place.'
'Unidentifieds?'
'Yes.'
'What kind?'
'Just lights. They've been flying all over Mount Rainier, but they

never came close.'
'No landings?' Epstein asked.

‘None reported,’ Stanford said. ‘Most of the lights were high up,

standing still, then shooting sideways, racing to and fro across the mountain peaks, disappearing, returning. Then this big light came down. All the smaller lights went into it. Then the big light climbed vertically and disappeared and hasn’t been seen since. That was an hour ago.’

Epstein nodded judiciously, gazing down at his folded hands, very frail in his pajamas, too frail, a man fading away. Stanford noticed the frailty – that and something else: a remoteness, a sort of dreamy look that seemed distinctly unnatural.

‘Are you okay?’ he asked.
‘Yes,’ Epstein said. ‘I’m fine.’
‘And how was Paris? What did you find out?’
‘You were right. It was Germany.’
Stanford was taking off his jacket, but he stopped and stared at

Epstein, his shock mixed with fear and excitement, disbelief and wild hope. Shrugging his jacket back on, he took a deep breath and released it slowly, snow melting on the shoulders of the jacket and dripping down to the carpet.

‘Germans?’

‘I don’t know,’ Epstein said. ‘I assumed so at first, but now I’m not so sure. I’m confused. I don’t know what to think.’
‘What has you confused?’
‘I have some cassette tapes,’ Epstein said. ‘It’s vital that you hear them. From what I was told in Paris, it seems almost certain that the Americans and the Canadians, and possibly the British, have their own flying saucers… But Scaduto was right: there are others involved. I don’t know who they are or where they come from or what they’re up to, but I *do* know that they’re not extraterrestrials and that they’re advanced to a frightening degree… It’s vital that you hear the tapes. They’re in my safe back in Washington. It’s vital that you go there right now and get them out of the safe.’
‘Right *now*?’

‘Yes.’
‘That’s ridiculous,’ Stanford said. ‘I’m exhausted. Just tell me what’s on them.’
‘There’s no time,’ Epstein said. ‘The tapes aren’t safe anymore. They want me and the tapes and they’ll get both before dawn breaks. You have to get there before them.’
Stanford stepped up to the bed and looked intently at Epstein, thinking that his friend had gone mad, wondering what he was talking about. Epstein was leaning against the pillows, his hands folded on his lap, his gray beard more shaggy than usual, his eyes slightly unfocused.
‘What are you talking about?’ Stanford asked. ‘I’m not sure I heard you right. *Who’s* going to get you and the tapes?’
Epstein didn’t look up. ‘I had a visitor,’ he said. ‘He murdered the Englishman and Scaduto. Now he wants me and the tapes. He said he’ll have both by first light.’
‘A visitor?’
‘Yes. He came here. He left just before you arrived. He knew all about Irving and Gerhardt and Richard Watson, about you, about me on the beach in the Caribbean. He knew about your encounter with the boys outside the ranch in Texas, and he knows about a lot of other things that he really shouldn’t know. He’s one of them, Stanford. He told me about saucers. He told me enough to convince me. I’ve no doubt that he’ll get me.’
Stanford sat on the edge of the bed, the melting snow still dripping off him, and stared at his old friend for some time before talking again.
‘Tell me,’ he said.
Epstein recounted the whole story, his voice eerily calm and remote. Stanford was fascinated, at once frightened and excited, his head filling with bright lights and pulsating coronas and glittering stars that moved majestically through black night and then blinked out abruptly. Epstein’s voice sounded tired, almost toneless, distracted, filtering through Stanford’s thoughts and out again. Stanford listened, mesmerized, the room dissolving around him, not fully comprehending what he was hearing, overwhelmed and struck dumb. Then Epstein stopped talking, sighed forlornly, examined his hands, turning them this way and that, and the walls of the room reappeared as the real world crept back. Stanford glanced around him, wondering where he was, *who* he was, then he managed to get a grip on himself, focusing once more on Epstein.

‘I find it hard to believe,’ he said.
‘It’s all true,’ Epstein said.
‘Jesus,’ Stanford said. ‘It’s too much. I just can’t get a hold on it.’
Epstein coughed into his fist. ‘You have to leave now,’ he said. ‘It’s vital that you get all the tapes before *they* make me talk.’
‘What makes you so sure you’ll talk?’
‘Because I’m convinced they’ll hypnotize me. Either that or they’ll put an electrode in my brain like they did to young Richard Watson.’
‘You think they’re coming back here tonight?’
‘Before first light,’ Epstein said. ‘So it’s vital that you leave right now and get there before them.’
‘Me?’ Stanford said.
‘I’m not going with you,’ Epstein said.
‘What the hell do you mean, you’re not coming with me? You can’t just sit there and *wait* for them.’
Epstein’s hands were shaking. ‘I don’t want to go,’ he said. ‘I’ve been trying to unravel this mystery for twenty years and now I’m going to have all my questions answered. They’re going to take me with them. I can’t miss this opportunity. I want to know who they are and where they come from, so I’ll have to go with them.’
‘Are you crazy?’ Stanford said. ‘Go with them and you won’t be coming back. Those bastards aren’t doing you any favors: once you go, you’ll be *gone*.’
Epstein shrugged, smiling sadly. ‘So what?’ he said. ‘Look at me. I look like a shadow of my former self. I’ve only about a year left anyway, so what can I lose?’
‘You’re crazy,’ Stanford said.
‘I have to know,’ Epstein said. ‘I can’t die without knowing the whole story – and this is my chance.’
‘I won’t let you.’
‘Get the tapes.’
‘No, damn it,’ Stanford said. ‘I won’t let you stay here. That’s it. Now put your clothes on.’
Epstein looked up at Stanford, smiling sadly, remotely; he was staring directly at Stanford, but not really seeing.
‘Leaving is pointless,’ he said. ‘If they want me, they’ll get me. It doesn’t matter where I go, where I hide, because they’ll know where to find me.’

‘Don’t bet on it.’
‘I *would* bet on it.’
‘Shut up,’ Stanford said. ‘I’m not listening. Now put your clothes on.’
Epstein smiled and nodded agreement, swung his legs off the bed, stood up and started dressing himself like a man still asleep. It didn’t matter if he left. He was certain that man would find him. He was certain that no matter what he did, that man would know he was doing it. This thought offered him some comfort, eased his pain, helped him relax, now enraptured with the thought of the revelations that would soon set him free. He would not die defeated. Death would not have dominion. He would wait and they would come, the night would turn to dazzling light, and he would blink and then open his eyes and see a world beyond reckoning. Epstein put his clothes on. When he was dressed, he glanced around him. He had only been here a few hours and yet he felt an odd sadness. It was not a painful sadness. His feeling of loss was couched in joy. Epstein buttoned up his coat and smiled at Stanford, prepared for just about anything.
‘Okay?’ Stanford said.
‘Okay,’ Epstein said.
‘Right, Professor Epstein, let’s go. Let’s get the hell out of here.’
They crossed the pine floor of the lodge, stepped out onto the porch, felt the cold and saw the snow falling as Stanford locked the front door. Stanford took hold of Epstein’s elbow, guided him down the slippery steps. The snow was thick on the ground, drifting lazily, as they walked to the car. Stanford helped Epstein in, holding his arm, keeping his eye on him, then he closed the door and went around the car and slipped into the driver’s seat. Epstein said nothing, simply smiled and looked ahead, as Stanford started the car and headed out through the tall, snow-lined trees.
‘Are you all right?’ he asked.
‘Yes, I’m fine,’ Epstein said.
‘Are you sure? You’re being pretty quiet.’
‘I feel fine,’ Epstein said.
Stanford drove between the trees, the snow gleaming in the darkness, the mountains jagged against the star-filled sky, rising up all around them. Stanford drove carefully, squinting against the falling snow, his headlights picking out tree-trunks and rocks and banks of exposed soil. He was nervous, excited, not sure what he was doing, glancing frequently at Epstein, at his smile, and wondering what he was thinking. The car rolled

down the narrow track, the trees seeming to glide past it, the snow drifting dreamily across the track, the darkness total beneath them.
'You know, it fits,' Stanford said, breaking the silence between them. 'A lot of what that guy, that Wilson, told you fits. The application of an antigravity shield *could* result in a virtually massless body. Now, according to technical analysis the lift-off of your average UFO would require as much energy as the detonation of an atomic bomb, would cause the body of the UFO to heat up to about eighty-five thousand degrees centigrade, and would lead to intense deposits of radioactivity. However, with an antigravity shield reducing the mass of the UFO to almost zero, it would only require a very modest force to reach exceptionally high accelerations. That would account for the UFOs' ability to disappear in the blinking of an eye and for the fact that they can be brought to an abrupt stop. It would also explain why they can make such normally impossible right-angle turns. Since we can also assume safely that the inertial mass of such a UFO would decrease the higher it goes, we can then reason that such a mass would be reduced to almost zero by the time it reaches the limits of Earth's atmosphere. This would explain why the UFOs invariably have what appears to be a twostage take-off: a slow rise to about a hundred feet or so, then a sudden acceleration and disappearance. Finally, since the UFOs' performance is directly related to Earth's gravity, and since the pull of gravity varies slightly from place to place, we now know why a UFO in horizontal flight often appears to rise and fall slightly: the increase and decrease of gravitational pull would affect the inertial mass of the UFO and make it bob up and down slightly; this would also explain why the UFOs appear to be able to automatically follow the profile of the terrain below… So, the facts fit.'
Still smiling sadly, his hands folded in his lap, his eyes slightly unfocused, fixed on the downhill road, Epstein nodded to indicate agreement.
'Still,' Stanford said, 'it's pretty fantastic. Wilson claimed he was a hundred and seven years old. If that's true, he's not human.'
'You don't think so?' Epstein asked.
'No, I don't think so. If that guy comes from Earth, I can't buy that. It's just too incredible.'
'I'm not so sure,' Epstein said. 'Bear in mind that whoever these people are, they're obviously extraordinarily advanced in their technology. Now, according to Wilson that technology includes medical and psychological

research with no restraint on the part of the researchers. They're definitely far advanced in parapsychology and prosthetics, and they practice vivisection on human beings.'
'Jesus Christ,' Stanford said.
'Yes,' Epstein said, 'it's horrible. But no matter, that's certainly what they're doing. Now assuming that their medical and surgical research is as advanced as their other sciences, it's not unreasonable to assume that Mr Wilson is the age he claims to be. What I *can* tell you is that his face was reconstructed with plastic surgery, that he uses a technologically advanced pacemaker, and that he's had various organs replaced. He also informed me that the work on him was performed at an early stage of their technology and that those methods were now considered to be relatively primitive. Presumably, then, it is indeed possible that Mr Wilson is a hundred and seven years old.'
'What does that make his date of birth?'
'1870.'
'No,' Stanford said, 'I can't accept this.'
'Think again,' Epstein said. 'A few people have actually managed to live to that age – and without medical assistance. Add medical and surgical assistance of the most advanced kind, and Mr Wilson could be exactly what he says he is.'
'Okay,' Stanford said. 'But *who* is he?'
'Have you ever heard of a Wilson in relation to UFOs?'
'No,' Stanford said. 'I can't think of anyone, except… No, it's too ridiculous for words.'
'What's ridiculous?' Epstein said. 'Don't be shy. I want to know what you mean.'
Stanford shook his head from side to side, expressing disbelief regarding what he was thinking. The headlights of the car were boring into the darkness as the vehicle moved downhill, the road winding around canyons and ravines, the land on both sides below them.
'The flap of 1897,' Stanford said. 'The first real modern sightings.'
'Don't blush,' Epstein said. 'Just keep talking. Make good use of that famous photographic memory of yours. I want every detail.'
'Okay,' Stanford said. 'As you know, the first major UFO flap was in 1896 – about November of that year – and continued until May the following year. This was five years *before* the Wright brothers' experiments, but there

were, by that time, various airship designs on the drawing boards or in the Patent Office. On August 11, 1896, a patent was given to Charles Abbot Smith of San Francisco for an airship he intended to have ready by the following year. Another patent for an airship was issued to Henry Heintz of Elkton, South Dakota, on April 20, 1897. However, I should point out that while many of the UFOs sighted were shaped roughly like the patent designs, there is no record of either airship having been built.'
'But the UFOs looked like airships?'
'At that time the general belief was that aerial navigation would be solved through an airship rather than a heavier-than-air flying machine
– so most of the earlier designs looked like dirigibles with a passenger car on the bottom.'
'Cigar-shaped.'
'Correct.'
'Please continue.'
'Okay, what stands out in the 1896 and 1897 sightings is that the UFOs were mostly cigar-shaped, that they frequently landed, and that their crews, normal men, often talked to the witnesses, usually asking for water for their machines. Now, the most intriguing of the numerous contactee stories involved a man who called himself Wilson. The first incident occurred in Beaumont, Texas, on April 19, 1897, when a guy called Ligon, local agent for Magnolia Brewery, and his son, noticing lights in the Johnson pasture a few hundred yards away, went to investigate. They came upon four men standing beside a large, dark object that neither of them could see clearly. One of the men asked Ligon for a bucket of water. When Ligon gave it to him, the man gave his name as Mr Wilson. He then told Ligon that he and his friends were traveling in a flying machine, that they had taken a trip, quote, "out of the Gulf", and that they were returning to the, quote, "quiet Iowa town" where the airship and four others like it had been constructed. When asked, Wilson explained that electricity powered the propellers and wings of the airship. Then he and his friends get back into the airship and Ligon, with his son, watched it ascending.
'The next day, on April 20, a Sheriff Baylor of Uvalde, also in Texas, went to investigate a strange light and voices in back of his house. He encountered a parked airship and three men – and one of the men gave his name as Wilson, from Goshen, New York. Wilson then inquired about a Captain Akers, former sheriff of Zavalia County, saying that he'd met him

in Fort Worth in 1877 and wanted to see him again. Surprised, Sheriff Baylor replied that Akers was now at Eagle Pass, and Wilson, apparently disappointed, asked to be remembered to him the next time Sheriff Baylor saw him. Baylor reported that the men from the airship wanted water and that Wilson requested that their visit be kept secret from the townspeople. Then he and the other men climbed back into the airship and watched it fly away northward in the direction of San Angelo. The county clerk also saw the airship as it was leaving the area.

'Two days later, in Josserand, Texas, a whirring sound woke farmer Frank Nichols, who looked out of his window and saw what he described as brilliant lights streaming from, quote, "a ponderous vessel of strange proportions" in his cornfield. Nichols went outside to investigate, but before he reached the object, two men walked up to him and asked if they could have water from his well. Nichols agreed to this
– as farmers in those days invariably did – and the men then invited him to visit the airship where he noticed that there were six or seven crew members. One of these men told Nichols that the ship's motive power was highly condensed electricity and that it was one of five that had been constructed in, quote, "a small town in Iowa" with the backing of a large stock company in New York.

'The next day, on April 23, witnesses described by the *Houston Post* as two responsible men reported that an airship had descended where they lived in Koutze, Texas, and that two of the occupants had given their names as Jackson and… Wilson.

'Four days after this incident, on April 27, the Galveston *Daily News* printed a letter from Captain Akers, the former sheriff of Zavalia County, who claimed that he had indeed known a man in Fort Worth named Wilson, that Wilson was from New York, that he was in his middle twenties, and that he was of a, quote "mechanical turn of mind" and was then working on aerial navigation and, in his own words, *something that would astonish the world*.

'Finally, early in the evening of April 30, in Deadwood, Texas, a farmer named Lagrone heard his horses bucking as if in stampede. Going outside, he saw a bright white light circling over the fields nearby and illuminating the entire area before descending and landing. Walking to the landing spot, Lagrone found a crew of five men, one of whom talked to him while the others collected water in rubber bags. The man informed Lagrone that his

airship was one of five that had been flying around the country recently, that his was in fact the same one that had landed in Beaumont a few days before, that all the airships had been constructed in an interior town in Illinois – which, note, borders Iowa – and that he was reluctant to say anything else because he hadn't yet taken out any patents. By May that same year, the airship sightings ended.'

The car rolled on down the mountain, snow still sweeping across the road, the dense forests gliding by on both sides, white and ghostly in darkness.

'Interesting,' Epstein said. 'It's certainly beginning to add up. And this Wilson appeared to be in his early twenties?'

'Exactly,' Stanford said. 'So assuming, as our Wilson claims, that he's a hundred and seven years old, in 1897 he'd have been twentyseven.'

'It fits,' Epstein said. 'Most of the facts fit. For instance, Wilson said that he'd originally studied aeronautics at the Massachusetts Institute of Technology and then at Cornell, New York.'

'You're kidding,' Stanford said.

'No, I'm not. He said he went to the MIT, but eventually left it to study under Octave Chanute… Does that make any sense to you?'

'Oh, Christ, yes,' Stanford said.

The snow swept across the headlights, the alluvial hills slid past, the sky formed a long, glittering ribbon between gaps in the trees.

'It's hard to believe,' Stanford said, 'but it's possibly true. Although there were no formal aeronautical courses at the MIT during the early 1890s, there were plenty of informal courses on propulsion and the behaviour of fluids. However, by 1896 instructors and students at the MIT had built a wind tunnel and were experimenting with it to get practical knowledge of aerodynamics. Wilson – our Wilson – could have attended those courses and then gone on to Sibley College, Cornell University, in Ithaca, New York, where, by the mid-1890s, it was possible to get a Bachelor of Science in Aeronautics.'

They were coming out of the mountains, the road straightening and leveling out, a dizzying drop on one side, soaring hills on the other, the snow banked up on both sides of the car, gleaming white in the darkness.

'So,' Epstein said. 'Wilson was born in 1870. In 1890, at the age of twenty, he was studying propulsion and the behaviour of fluids at the MIT, after which he went on to Cornell to study aerodynamics. Let us say, then, that by the mid-1890s he'd obtained his Bachelor of Science in Aerodynamics.

Assuming he's a genius, we can then also assume that when he left Cornell, he went straight into the designing and constructing of flying machines. Now, bearing in mind the enormous interest there was at that time in the possibilities of such machines – and the fact that numerous researchers and inventors were obsessed with the possible theft or plagiarism of their designs – the need for secrecy would certainly have been paramount. Given this, it *is* possible that our Wilson was financed by some stock company in New York to set up a secret aeronautical research complex in the sparsely populated wilds of Illinois or Iowa. It is therefore also possible – still assuming that our Wilson is a genius – that he could have built the first airship by 1896.'

'Christ!' Stanford exclaimed. 'Jesus Christ! Which gets us to your tapes.'

'Correct,' Epstein said.

'What's on them?' Stanford asked. 'Tell me what's on the tapes. I can't wait till we get to DC. I have to know *now*!'

Epstein didn't reply. Stanford turned and looked at him. He just sat there with his head tilted toward one shoulder, his eyes closed, breathing deeply. Stanford smacked him on the shoulder, but Epstein didn't respond. Stanford cursed and glanced out at the swirling snow and then looked back at Epstein. He was still breathing deeply, his eyes closed as if asleep, and Stanford shook him and received no response and felt a sharp, stabbing panic. He shook Epstein again, loudly called out his name, but Epstein still didn't wake up. Stanford was confused, not knowing what was going on, thinking Epstein might have had some kind of stroke, wondering what he could do. They were a long way from Washington. The mountains soared behind them. Ahead, on both sides of the road, the hills climbed into darkness. Stanford cursed and stopped the car, twisted sideways, shook Epstein. The latter blinked and then opened his eyes properly and looked vaguely around him.

'Where are we?' he asked.

'Nowhere,' Stanford said. 'I had to stop the car to waken you. I was worried that something had happened to you.'

'I fell asleep?'

'That's what it looked like. I just blinked and you were gone. I've never seen anyone fall asleep that fast and it gave me a fright.'

Epstein smiled. 'My apologies.'

'Are you sure you're okay?'

‘Of course,’ Epstein said. ‘I feel fine. I don’t know what happened… All the flying… Jet lag.’
‘Can I go now?’ Stanford said.
‘Certainly. Please do.’
‘Good,’ Stanford said. ‘I’m relieved. I don’t like it out here.’
He turned the ignition key. When nothing happened, he tried again. Nothing happened and he cursed and tried a third time, but still nothing happened. He glanced at Epstein, saw his eyes gradually closing. Stanford cursed and then tried the car a fourth time, but still nothing happened. The engine was completely dead. Stanford didn’t understand that. He looked around him, saw the thick, spiraling snow, the hills covered in pine trees. Stanford looked again at Epstein. The old man was asleep. Frightened, Stanford opened his door and slipped out of the car.
The wind was light but icy, Shivering, Stanford went to the front of the car and raised the hood. He beamed his flashlight on the engine, examined the spark plugs, the carbureter, the works, but couldn’t find anything wrong. Stanford shivered with cold. The snow was settling on the engine. He turned the flashlight off and went back around the car to try the ignition again. He bent forward to climb in, stopped, blinked a few times, then saw that the other door was open and that Epstein was missing.
Stanford straightened up quickly, feeling panic, his heart racing, looking over the car, across the road, at the tree-covered slopes. The trees were tall and close together, blocking out the moonlight, the white snow disappearing into darkness where the slope became steep. Then he saw Professor Epstein, stooped over, coat flapping, clambering up the slope and heading through the trees, the snow swirling about him.
Stanford bawled Epstein’s name, but Epstein didn’t glance back. He had passed the first trees, his feet kicking up the snow, disappearing, reappearing, clambering uphill. Stanford looked beyond him. A chill ran down his spine. He saw the light beyond the trees, rising up, spreading out, a glowing fan at the top of the hill, growing larger each second.
‘Oh, my God!’ Stanford whispered.
He hammered the car with his fist, ran around it, followed Epstein, his feet sinking into the snow as he crossed the dark road. The wind was sharp and icy, blowing the snow into his face, and he put his hand over his face until he reached the first trees. Looking up, he saw Epstein… heading determinedly for the pulsating light that fanned out in the black sky.

Then Stanford heard something, thought he *felt* it, wasn't sure. He jerked his head back and looked directly above him and went numb all over. There was no sky above. There was just a total blackness: a blackness that wiped out the moon and stars and was utterly physical. Stanford kept looking up. He couldn't believe what was happening. The blackness went as far as he could see and seemed to be bearing down upon him.

Stanford looked again for Epstein. He saw him moving between the trees, The light fanned out above the brow of the hill, glowing and pulsating. Stanford bawled Epstein's name, but Epstein didn't glance back. Stanford cursed and started hurrying up the hill, the air vibrating around him. He heard the sound or *felt* it, wasn't sure what it was, slowed down and started slipping and sliding, his head tight, his lungs bursting. Then he fell and rolled over, looked up and saw the light, saw Epstein clambering up toward the light with unnatural energy.

Stanford lay there in the snow. He looked up and saw the light spreading out and enveloping Epstein. Then two figures materialized. Both were silhouetted. They came up over the brow of the hill, moving steadily, methodically. They stopped and stood still and were framed by the fan of light. Epstein straightened up and walked up to the figures and one reached out and touched him. Stanford lay there, looking uphill, unable to move. Epstein merged with the two silhouettes and then they all walked away, vanishing over the hill. Stanford lay there for what seemed like a long time, the vibrating sound numbing him.

The snow continued falling. The fan of light started fading. It grew weaker and smaller, shrank to nothing, and then disappeared. Stanford lay there in the snow, watching the brow of the hill. A line of white lights rose out of the darkness to climb slowly and vertically. Then the vibrating ceased. The dark night was filled with light. Stanford jerked his head back and looked above him and shielded his eyes.

There was light in the blackness, a perfect circle, growing larger, spreading out and hurling down a dazzling radiance that turned the night into daytime. Stanford shielded his eyes. He squinted up at that pool of light. He saw the other line of lights gliding over from the hill and merging with the fierce light above him and then disappearing.

Stanford closed his eyes. They were watering and stinging. He blinked and looked up again and saw the dazzling white light. There was a black disk in the middle. The larger circle of light was shrinking. It kept shrinking until it

swallowed the black disk and the blackness was total.
Stanford kept looking up. He saw nothing but the blackness. He lowered his gaze and looked back along the road and saw a ribbon of stars. The blackness ended back there. The ribbon of stars was growing wider. The far edge of the blackness was receding and racing toward him. Stanford looked the other way. He saw the very same thing. He saw a ribbon of stars growing wider as the blackness raced toward him. Then he looked up again. He saw nothing but the blackness. He looked around him and saw the emerging stars as the black mass kept shrinking. It shrank as it ascended. The stars raced in on all sides. Stanford looked up and saw the dwindling darkness with the stars all around it. It finally became a small black disk. The disk shrank and disappeared. Stanford looked up and saw the starry sky, the moon wreathed in clouds.
The tightness left Stanford's head. He stood up and then walked up the hill until he stood at the top. He looked down the other side, saw a snow-white, empty field. He turned around and stumbled back down to the car, feeling outrage and grief. He turned the ignition key. The car roared back into life. Stanford drove back to Washington, DC, the loss of Epstein tearing at him, now determined to get the tapes in the safe before he, too, was taken.

Chapter Twenty-Eight

February 22, 1945. The guns roared in the distance, the skies were filled with smoke, and we had to destroy the Kugelblitz and make good our escape. I remember it well. I had to wrap myself in ice. The sleek saucer stretched across the broken stones at the base of the mountain. We had removed the new components. We had to leave the rest behind. We couldn't let what remained fall to the enemy, and so we had to destroy it. I stood near the hangar doors. General Kammler was not present. The forested hills of Kahla were all around us and veiled in a thin mist. I glanced at General Nebe. His swarthy face revealed nothing. My fellow scientists and technicians were just behind me, their eyes fixed on the saucer. The guns roared in the distance. The saucer glittered in the sunlight. Nebe's demolition men were standing under it, grouped around the four legs. One of the men waved his hand. General Nebe nodded soundlessly. All the men moved away from the saucer and returned to the hangar.

I no longer accepted pain. It was a redundant emotion. Nonetheless, as I gazed at my great creation, I had to harden myself. The saucer looked enormous, its sloping sides a seamless gray, sweeping up to a steel-plated dome and reflecting the sunlight. It looked very beautiful. It also looked quite unreal. What I felt was a fleeting sense of loss, but I rigorously stifled it. I just stood there, saying nothing. General needed nodded again. A kneeling sergeant leaned forward and pressed a plunger and the saucer exploded.

Fierce flames and swirling smoke. We were crouched behind sandbags. The explosions reverberated throughout the hangar and then faded away. We all stood up slowly. The smoke was billowing toward the sky. Where the saucer had stood there was a black hole, filled with smoldering debris.

I found myself speechless. I turned away and faced Nebe. His dark eyes and humorless face displayed no sign of sympathy. He just shrugged and surveyed the hangar. It was immense and filled with workers. The workers were lined up against the walls, being guarded by soldiers. Nebe's dark eyes were watchful. He murmured an order to the sergeant. The sergeant barked further orders to this troops and they all raised their weapons. The prisoners moved immediately. They placed their hands on their heads. Silent, their eyes as dead as the moon, they marched out of the hangar.

The destruction began. We would leave little to the Allies. All that day the ground rocked to explosions and the shrieking of bullets. A dark smoke boiled from the hangar. The long tunnels were filled with flames. The technicians stood outside, bemused, as their laboratories crumbled. Soldiers darted to and fro. Hand grenades curved through the air. The flames daggered through the black smoke and splashed down on the ground.

Other guns roared in the distance. The horizon was smokey. The enemy was advancing every minute and our time became precious. We all rushed to pack the trucks. The largest crate was first to leave. In the crate were the numerous new components, without which we'd be lost. I climbed in beside the crate. I glanced out and saw the prisoners. They were kneeling in great numbers on the ground, the smoke drifting around them. I did not look very long. They were destined for Buchenwald. When they turned to smoke and

ash in the crematoria, what they knew would die with them. I reached out and touched the crate. General Nebe waved from the murk. The truck growled and then rumbled down the hill as the destruction continued.

Darkness was descending. Allied guns roared in the distance. The truck started rocking from side to side and the large crate swayed dangerously. I reached out and touched it. I thought briefly of Rudolph Schriever. The Flugkapitän was still working in Mahren, racing to finish his saucer. As the guns roared, I smiled. Schriever's saucer would never work. I stroked the large wooden crate with loving fingers and felt a deep peace. The truck shuddered and then stopped. I heard the hissing of steam. Looking out, I saw the mass of milling workers approaching the train.

We unloaded in darkness. The crate was moved with great care. A battalion of SS troops marched by, their guns and knives gleaming. They were all youthful fanatics. They were General Nebe's disciples. They had deserted after the attempt on Hitler's life and now were going with us. The war raged on in the distance. The train clanged and spat steam. The slave workers were stripped to the waist, sweating under the cracking whips. I watched the crate being loaded. It bumped against the long carriage. I cursed the man who was operating the crane and he lowered his head. The crate was then lowered more carefully. Blackened hands pushed it inside. The doors were closed and the slaves were ordered away as I walked to the platform.

Allied planes growled overhead. I heard the crack of a rifle. A dog snarled and a man started screaming as I reached the dark platform. Clouds of steam swirled around me. Troops were entering the train. The ground shuddered and I saw flames in the distance, flaring up in the black night. Men were shouting and jostling. A torch shone in my face. General Nebe materialized from the murk, his dark eyes unrevealing. He pointed up to the nearest carriage. I saw the peaked caps of the officers. I nodded and we both boarded the train and closed the door hard behind us.

The carriage was packed and noisy. A sweating corporal pulled the blinds down. Once finished, he turned on all the lights and I felt my eyes stinging. Most of the officers were disheveled. Their ties were loose and their shirts were soaked. The air was blue with cigaret smoke, smelt of ash and fresh sweat. General Nebe murmured something. Two men jumped to their feet.

They saluted and then marched away, leaving two empty seats. Nebe indicated one of them. When I sat down, he sat beside me. The two officers seated opposite froze visibly and then lowered their eyes. Nebe yawned and glanced around him. His rough face was expressionless. Shortly after, with much clanging and groaning, the train started moving.

The night was long and miserable. The train stopped and started often. Allied planes growled continuously overhead, the guns boomed in the distance. The officers smoked and played cards. Their ears cocked when they heard explosions. Nebe slept with his mouth pursed and whistling, his head hanging heavily. General Kammler was not present. He was busy elsewhere. That same night he was moving the scientists from Peenemünde to the mine shafts of Bleicherode. He had suggested the move to Himmler. It was a cunning thing to do. Its purpose was to distract Himmler's attention while we made our escape. The Reichsführer was in a panic. He had forgotten about the wilderness. He was now more concerned with the V-2 rockets, and with young Schriever's saucer. The guns roared as I smiled. I thought of Schriever back in Mahren. That fool would still be working on his saucer when the Allies arrived.

We were bombed a few hours later. I remember my annoyance. The sudden roaring almost split my eardrums as I plunged to the floor. The bending tracks shrieked. My one thought was for the crate. The whole carriage rose up and crashed down and then rolled onto its side. The noise was catastrophic. Men screamed as seats buckled. I went sliding along the floor and struck a wall and rolled over a flailing man. Flying pieces of wood and spinning chairs. A smashed head pouring blood. I turned around and saw the windows above me, glass shattered and glinting. Men screamed and bawled curses. I jumped back to my feet. A bloody corporal formed a stirrup with his hands and Nebe planted his boot in it. The corporal heaved the general up. I saw the mass of dangling legs. More bombs fell and exploded around the train as I found a cleared space. I pulled myself up through the window. The night roared and spewed flame. I crawled away from the window and rolled off and crashed down to the ground.

My one thought was for the crate. I ran toward the long carriage. Men were falling off the train and crashing down and then rolling away from me. The

whole scene was chaotic. A silhouette was bawling orders. I clawed two or three men from my path and then saw the long carriage. General Nebe was already there. There were three trucks near the train. A dozen men were laboring under my crate, their backs bent, their necks straining. Another bomb fell nearby. Nebe stepped forward to bark an order. The men heaved the crate onto the truck and then collapsed from the effort. General Nebe's jackboot glistened. He kicked one of the lolling men. The men jumped up and grabbed at their weapons and clambered into the truck. Nebe waved his right hand. I climbed up beside the driver. Nebe followed me in, barked an order, and then the truck began moving. Allied planes passed overhead. A gray dawn was breaking. There was another truck in front, one behind, and we kept moving forward.

The breaking dawn was filled with smoke. The landscape was devastated. Charred trees and smoldering buildings and corpses, ragged columns of refugees. The refugees were going the other way. Allied planes flew overhead. The trucks growled and bumped along the dusty roads as the smoke cleared away. A drab country: anonymous. The devastation remained. The blackened buildings were no longer smoldering: the ash had turned cold. We stopped and started often. Darkness fell and brought a stark, chilling silence that gave way to the murmuring sea.

We stopped just outside Kiel. The fields were flat and barren. I saw a\hangar, a series of low bunkers, a few bleak, concrete buildings. There we stayed for five weeks. The crate was hidden in a bunker. Every day I went down to inspect it, wanting desperately to leave. Each day was the same. The men smoked and played cards. Allied planes rumbled over our heads, but always kept flying south. Long days and freezing nights. I toyed with mathematical riddles. It was wet and the SS men were drawn to the flickering ovens. General Nebe kept to himself. His dark eyes were unrevealing. He slept soundly, his mouth puckered and whistling, his heavy legs outstretched. Dawn drifted into dusk. The Allied planes flew overhead. I often studied the SS men in the bunkers, wondering what they were thinking. They all seemed to be very young. Most were handsome and sweet-faced. All had dipped their hands in blood and tortured the helpless, few would suffer from sleepless nights. I wondered how we could take them

all. I didn't believe we had the space. A cold wind came and chilled us to the bone and Nebe said we were moving out.

We drove down through Kiel. A fine mist veiled the darkness. I was sitting in the back of a truck, the wooden crate towering over me. I thought of Kammler in Oberammergau. I wondered if he had escaped. I thought of Wernher von Braun and Dornberger and wondered what would become of them. Kammler might still be with them. He might be down there in Kiel. I ran my fingers along the length of the crate and then we came to the docks.

The trucks squealed to a halt. The crate shuddered and then was still. General Nebe's dark eyes appeared from dense mist and he motioned me out. I jumped down, feeling stiff. The docks were very quiet. The black water reflected the lamps beaming down on the submarines. I glanced keenly around me. Nebe was murmuring to some troops. The men formed up in a neatly spaced line against the wall of a hangar. Other men were at my crate. They worked slowly and carefully. I glanced down at the submarine just below me: U-977. There were men on the deck. They were grouped around the hold. Chains rattled and I saw my precious crate dangling over the water. There was a moment's hesitation. The crate was jerked and started spinning. Hands reached up and guided it down until it dropped out of sight.

General Kammler appeared on deck. He was accompanied by Captain Schaeffer. Both men climbed up the ladder to the dock and approached General Nebe. Kammler spoke in a low voice. He kept glancing along the dock. His shadow trailed out along the wet stones and smothered my feet. General Nebe turned away. He murmured something to his sergeant. General Kammler took a torch from his pocket and flashed it three times. I glanced along the dock. I saw the lights of another truck. The truck growled and then started toward us, its headlights turned down. General Kammler walked up to me. He introduced me to Captain Schaeffer. We shook hands as the truck pulled up near us and turned toward the water.

The SS troops were silent. They formed a line along the hangar. The sergeant stepped back and bellowed an order and the troops faced the wall. I heard their weapons rattling. Their boots rang on the stones. The truck stopped, overlooking the water, and then its ramp was thrown down.

A shocking noise split the silence. I shook my head to clear it. The SS troops lined up along the hangar were jerking and wriggling. My eyes turned toward the truck. I saw a barrel spitting flames. The machine gun was roaring and rattling as the men screamed and died. When I blinked, there was silence. A grey smoke drifted lazily. The tall wall of the hangar was filled with holes and splashed with fresh blood. The men all lay on the ground, sprawled across one another. Their large pupils reflected the lamps beaming down on their faces.

Captain Schaeffer turned away. I saw Kammler's tight lips. General Nebe took his pistol from its holster and then cocked the hammer. He nodded to his sergeant. They both approached the bloodied men. Most were silent, but a few were still whimpering, their hands opening and closing. General Nebe fired the first shot. His sergeant fired the second. They took turns, bending over the bodies, their gunshots reverberating. It seemed to take a long time. It did not take long at all. When they had finished, General Nebe turned away and waved his free hand.

Some men jumped out of the truck. The machine gun's barrel clanged. General Nebe returned his pistol to its holster and then walked toward us. There was no sweat on his brow. His dark eyes were unrevealing. He nodded and we all turned away and climbed down to the submarines.

We moved out shortly after. We did not go very far. I stood with Nebe and Kammler on the deck and watched the men on the dock. There were only four men. They worked long and hard. They put the bodies of their dead comrades in the truck and drove it into the hangar. The dock was very quiet. Its lamps beamed down on the wet stones. More Allied planes rumbled overhead as the four men emerged again. They were not in the truck. They merged gradually with the darkness. They climbed down the steel ladder one by one and dropped into a dinghy. The oars splashed in the water. The distant lamps showed desolation. After what seemed like a very long time the men arrived at the submarine. They were all helped aboard. The dinghy drifted away. I stared back across the water to the dock and saw the lamps on the hangar.

The explosion was catastrophic. The whole hangar disintegrated. The flames shot up in jagged, yellow lines that turned the night into daytime.

The noise was demoniac. A black smoke billowed out. The flames swirled and turned into crimson tendrils that embraced one another. Then the smoke drifted sideways, revealing the rubble. Flames leaped across the charred, broken beams and stained the road with shifting shadows. The flames burned a long time. The harsh wind made them dance. They were still burning brightly when we submerged and disappeared in the Baltic Sea.

Chapter Twenty-Nine

EDITED TRANSCRIPT GER/0023/DEC 3 77
TAPED INTERVIEW BETWEEN DR FREDERICK EPSTEIN &
PROFESSOR RONALD MANSFIELD OF THE GROUPMENT
D'ETUDES DES PHENOMENES
AERIENS
LOCATION: PARIS, FRANCE, AS ABOVE
INTERVIEW DATE: NOV 27 77
EPSTEIN EDITED OUT

Tape 1:

Yes, Dr Epstein, it is of course true that we in the British Intelligence Objectives Sub-Committee were particularly interested in German scientific progress during the Second World War. It must be borne in mind that from the moment Hitler took power, in 1933, a gross militarism prevailed and all outstanding German scientists were compelled, despite their personal beliefs, to work on military projects. Now most of that work was concerned with the production of various kinds of advanced weaponry, but as early as 1934 there was talk emerging from Germany about even more disturbing projects, such as aerial torpedoes, pilotless aircraft, remote-controlled rockets, long-range guns, and mysterious death rays – so quite naturally we worried. Our anxieties were increased when, in 1942, various resistance groups informed us of the flying bombs and giant rockets being constructed at a secret research establishment at Peenemünde; and then we started receiving reports, from experienced pilots, of mysterious 'fireballs' that were harassing them on their bombing runs over occupied Europe.

Confirmation that the Peenemünde experiments had been successful came on June 13, 1944, when the first V-1 flying bombs fell on England, and, more forcefully, on September 6 the same year, when the first of the V-2 rockets devastated parts of Chiswick and Epping. Since these fearsome inventions were dropping on London and surrounding areas, the populace was obviously aware of them; however, what the populace did not know – and what we were not about to reveal
– was that many Allied pilots had started returning from bombing runs with wild tales of being pursued by mysterious 'fireballs' that made their aircraft's ignition and radar malfunction.

The first recorded incidence came from Lieutenant Edward Schlueter of the 415th US Night Fighter Squadron. Reportedly, on the night of November 23, 1944, Lieutenant Schlueter was flying in a heavy night fighter over the Rhine, about twenty miles from Strasbourg, when he and Air Intelligence Lieutenant Fred Ringwall glanced out of their darkened cockpit and saw 'ten small balls of reddish fire' flying in formation at what they claimed was amazing speed. The lights followed the aircraft for some time, were pursued and disappeared, returned and seemingly caused the aircraft's ignition and radar to malfunction. The 'balls of fire' eventually vanished over the Siegfried Line.

Four days later, on the night of November 27, pilots Henry Giblin and Walter Cleary submitted an official report stating that their airplane had been harassed over the vicinity of Speyer by 'an enormous burning light' that was flying fifteen hundred feet above their plane at about two hundred and fifty miles per hour and seemingly caused their radar to malfunction. This report was followed by a sudden spate of similar reports, most of which agreed that the objects were large, bright, orange lights, that they appeared to *ascend* from low altitude, and that when they leveled out and followed the aircraft there were inexplicable ignition and radar malfunctions. Finally, when on January 12, 1945. Several bomber squadrons *simultaneously* reported seeing the lights, we decided to open a dossier on the subject.

Naturally, when the war ended, our major priority was to take under our control as much as possible of the documents, drawings and actual

components belonging to Nazi Germany's scientific and military research. Regarding this, the Red Army moved into the enormous underground rocket factory in Nordhausen in the Harz Mountains, where they took charge of almost completed flying bombs and rockets, numerous precision tools and parts, and over three thousand research workers from Pennemünde, including leading scientist Helmut Grottrup and quite a few other rocket experts – all of whom disappeared into the Soviet Union to create God knows what. The Americans, on the other hand, managed to get their hands on over a hundred V-2 rockets, five cases of hidden and highly secret Peenemünde documents and, of course, the very famous Wernher von Braun, a few hundred other V-2 specialists, and another hundred-odd scientists who were intimate with the various Peenemünde projects.

I give you these figures not just to impress upon you the fact that both the Soviets and the Americans gained from this division much of the material, human and otherwise, vital to advanced weaponry research and the exploration of space, but also to impress upon you the sheer *size* of the German projects.

And the British? It was our intention right from the start – as it was doubtless the intention of the Soviets and the Americans – to complete the picture on the state of development of German research on guided missiles, supersonic aircraft and other secret weapons. Apropos of this, we sent teams of specialists belonging to the Ministry of Aircraft Production all over western Germany and Austria, their brief being to locate every cave, disused mine, tunnel, ravine or forest where secret German establishments might be hidden and, once having located them, to dismantle and return to England the most valuable or enigmatic equipment, even including the Germans' quite extraordinary wind tunnels.

Since the British zone of occupation extended from the Dutch frontier to Prussia, centering on the invaluable port of Hamburg and including a large part of the eastern Alpine massif in Austria, we really did quite well out of the deal. The movement of this mass of captured documents and equipment was discreetly controlled by the British Intelligence Objectives Sub-Committee, and in general it was transported to Hamburg, shipped from there to England, and from there distributed to various interested parties

such as the experimental center then being built at Bedford, the Royal Radar Establishment at Great Malvern, the Telecommunications Research Establishment, and other top-secret establishments in Canada and Australia.

Working under British Intelligence, my job was to organize the Anglo-Canadian teams of scientists who would scrutinize every aspect of the captured German technology. Our main concern was with unraveling the mystery of certain German secret weapons that may, or may not, have existed. These would have included the Foo Fighter or 'ball of fire' that reportedly harassed so many Allied pilots; the 'circular German fighter without wings or rudder' which, according to one reliable source, crossed the flight path of a four-engined Liberator at very high speed, gave off a number of little 'bluish' clouds of smoke, and caused the Liberator to catch fire and eventually exploded; and the 'strange flying machine, hemispherical or circular in shape' that reportedly flew at incredible speed, attacked a whole convoy of twelve US night fighters, and destroyed them without using visible weapons. Naturally, being British, we approached our task with a certain skepticism – but such skepticism would shortly be dispelled and replaced with amazement.

Let me briefly summarize what we found. First, whether or not the mysterious aircraft that sprayed those bluish clouds of smoke over the unfortunate Liberator was 'a circular German fighter without wings or rudder', it certainly could have caused that aircraft to explode without using its guns. We came to this conclusion when we discovered that documents recovered from the technical departments of factories hidden in the densely forested areas of the Schwarzwald contained details of experiments conducted with a liquid gas that would, when blown with considerable force over an aircraft, catch fire from the aircraft's exhaust fumes and cause the aircraft to explode. The existence of this gas was confirmed by one Dr Rosenstein, an organic chemist and Jewish collaborator who, when interrogated by members of the American Aslos Mission in Paris in 1944, stated that the Germans had succeeded in perfecting a new gas whose use would have caused 'strong vibrations and even breakage in aircraft engines' by encouraging immediate and repeated self-ignition.

In this context, it is worth noting that in April 1945, on the outskirts of the Hillersleben testing grounds west of Berlin, members of the Intelligence Technical Branch of the 12th Army Group found the rusty remains of a rather odd item called the *Windkanone* – a cannon that shot gas instead of shells – and another odd item called the *Wirbelringkanone*, or whirlwind annular vortex cannon, which was designed to shoot, and then ignite, a gas ring that would spin rapidly on its own axis and form a rather fierce 'ball of fire'.

Regarding the possibility that the 'circular German plane without wings or rudder' might have been some kind of remote-controlled flying device, we discovered that as far back as 1939 Dr Fernseh of Berlin, in collaboration with Professor Herbert Wagner of the Henschel Aircraft Company, was working on the development of a television component that would enable pilots to control bombs and rocket bombs *after* they had been launched; that Fernseh was also involved in the development of a microtelevision camera that would be installed in the nose of an antiaircraft rocket and guide it precisely to its target; and that similar projects were quite commonplace in Nazi Germany – and, more importantly, highly successful.

Naturally, such information led us back into an investigation of the apparently remote-controlled German 'fireballs'. What we found was that Messerschmitt had developed two workable radio-controlled interceptor planes, the *Krache* and the *Donner*, that these were initially designed to be controlled from the ground by a television receiver installed in an armored console, but that certain negative aspects to the system led to the development of numerous highly advanced electromagnetic, electroacoustical and photoelectric fuses, and to even more advanced warheads that were sensitive to the natural electrostatic fields that surround aircraft in flight. Indeed, some of those devices were incorporated into 'automatic' aircraft weapons, with the result that all a German pilot had to do was flying his plane a few hundred yards beneath or above his target and the automatic firing mechanism would operate. Thus, by installing similar devices in a pilotless interceptor rocket, the Germans could engage in aerial combat without using pilots.

The devices I've just mentioned led inevitably to a more solid version of the original 'wind-cannon' idea. By 1945 a Luftwaffe experimental center in Oberammergau in Bavaria had completed its research into an apparatus capable of short-circuiting the ignition system of an aircraft's engine at a distance of about a hundred feet by producing an intense electrical field. Their intention – aborted by the ending of the war – was to expand the field greatly, but certainly, by the middle of 1944, they had incorporated the device into a weapon actually called the *Feuerball*, or 'fireball'.

The *Feuerball* was first constructed at the aeronautical factory at Wiener Neustadt. Basically, it was an armored, disk-shaped object, powered by a special turbojet engine, which was radio-controlled at the moment of take-off, but then, attracted by the enemy aircraft's exhaust fumes, automatically followed that aircraft, automatically avoided colliding with it, and automatically short-circuited the aircraft's radar and ignition systems. During the day this device looked exactly like 'a shining disk spinning on its axis' – which may account for the first Allied newspaper reports of 'silver balls' observed in the skies over Germany – and by night it looked like a 'burning globe'. The 'burning globe' was actually a fiery halo around the solid device, caused by the very rich chemical mixture that over-ionized the atmosphere in the vicinity of the target and thus subjected it to extremely damaging electromagnetic impulses. It is also worth noting – with regard to the fact that the *Feuerballs* reportedly flew away when attacked – that under the armored plating of the *Feuerball* was a thin sheet of aluminum that acted as a defensive 'switch'; a bullet piercing the armored plating would automatically establish contact with the switch, trip a maximum acceleration device, and cause the *Feuerball* to fly vertically out of range of enemy gunfire. In short: the *Feuerball* really existed, it was described accurately by our pilots, and it was used with great effect from about November 1944 to the end of the war.

At this point I feel I should remind that from as far back as 1942 the German military establishment had encouraged every kind of research and experiment in the field of jet propulsion and advanced remote-control systems. However, after the attempted assassination of Hitler on July 20, 1944, Hitler in a bout of vengeful fury, turned control of the planning and construction of these astonishing new weapons over to Himmler's dreaded

SS. I mention this because the SS were, by that stage of the war, a self-ruling and highly secretive body with their own research centers and construction plants and factories, many of which even Hitler didn't know about. In other words, from that point on the fate of many of the secret weapons was even more difficult to trace – and indeed, in many cases is not known even to this day.

What we *do* know is that many of the leading scientific establishments were evacuated totally and transferred to vast underground complexes scattered all over Germany, most notably in the area of the aborted Alpine redoubt. Once transferred, they were virtually sealed off from the outer world, rigidly controlled by the SS, and forced to concentrate their attention on nothing other than advanced military projects. Given that this work went on twenty-four hours a day, that even the scientists worked in shifts, and that thousands of slave workers from the concentration camps were at their disposal, there can be little doubt that some extraordinary advances were made in those secret research plants.

Unfortunately the SS, when retreating from the Allies, destroyed much of this remarkable research. Unfortunate because what we often found were highly advanced but frustratingly incomplete documents, isolated parts of obviously complex components, and a wealth of other odds and ends that could have belonged to just about anything. Even more disturbing was the fact that thousands of slave workers who had been used in such establishments had, with their SS overlords, simply disappeared by the time we arrived there – and few of them were ever located again.

So, my evaluations are incomplete. Nevertheless, regarding the 'wingless' aircraft so often reported, we did collect enough material to tantalize us and keep us involved for years. Found across the length and breadth of Nazi Germany were not only the V-1 flying bombs and V-2 rockets, the gas cannons and *Feuerballs*, and the extraordinary variety of automatic flying devices and infrared warheads, but also a considerable number of highly advanced U-XX1 and U-XXIII submarines, almost completed ME-262 jet fighters, a nearly completed atom-bomb project, the prototypes for various vertical-rising aircraft, and even, in the immense underground Riva del Garda research complex, the manufacturing process for a metallic material

that could withstand temperatures of about one thousand degrees Centigrade. So, as you can imagine, the Germans were on the verge of some truly remarkable developments.

Tape 2:

There are two problems standing in the way of a supersonic, completely circular aircraft: one is the need for gyroscopic stabilization and the other is control of the boundary layer. It is therefore worth noting that scientists of the Kreiselgerate at Berlin Britz had, in 1943, worked on the construction of mechanisms employing gyroscopic phenomenon and succeeded in reducing the oscillations of a violently shaken body to under a tenth of a degree. This was, of course, a most important achievement – and added to control of Prandt's 'boundary layer' it would have led to some extraordinary advances in aerodynamics.

Let me briefly explain this 'boundary layer'. While being four or five times less viscous than oil, air *is*, nonetheless, viscous. Because of this, the air sweeping in on the solid body of an aircraft forms imperceptible stratifications of resistance and consequently decreases the speed of the body in flight. These layers of air are known as the 'boundary layer' – and the boundary layer increases its resistance in direct proportion to the increasing speed of the flying object.

In layman's terms, therefore, the major problem regarding supersonic flight was to somehow or other move this negative air as far to the rear of the aircraft as possible, thus minimizing the expenditure of energy required to propel the aircraft through the sky. Further: it is possible that a revolutionary type of aircraft could – by not only *completely* removing the boundary layer, but by somehow re-routing it and utilizing it as an added propulsive force – fly through the skies using little other than the expelled air itself. Should this be accomplished we would have an aircraft capable of remarkable speeds while utilizing the barest minimum of fuel.

By 1945 – or so our captured German papers indicated – both the LFA at Volkenrode and the research center at Guidonia were working on a revolutionary new type of aircraft that was devoid of all obstructing protuberances, such as wings and rudders, was devoid even of the normal

air intakes, and was powered by a highly advanced turbine engine. In short, the new aircraft was a ‘flying wing’ that offered the least possible air resistance, sucked in the ‘dead air’ of the boundary layer, and then used that same air, expelling it at great force, to increase its momentum.

Whether or not that aircraft was actually developed and flown is not known. What we did know, however, was that the *Feuerball* really existed, that it took the form of a circular ‘wing’, that the wing was in a sense wrapped around the suction pump, and that the pump was part and parcel of the engine. In other words, the *Feuerball* was a perfectly symmetrical disk, devoid of all surface protuberances – the first small flying saucer.

Nevertheless, with the *Feuerball* the boundary layer would still have been present, albeit drastically reduced. In order to get rid of the boundary layer completely – and in order to make use of the ‘dead air’ not only for acceleration but for maneuvering as well – what was required was a porous metal that would act like a sponge and remove the need for air intakes altogether. This need led scientists into the exploration of what would henceforth be called, in the words of the German engineer Schrenk, ‘frictionless air flow’ and which would result, according to Sir Ben Lockspeiser, in an aircraft that would ‘slip through the air in the same way as a piece of wet soap slips through the fingers.’ I mention this because certain documents discovered by us in both Gottingen and Volkenrode indicated that between 1943 and 1944 the German scientists had been completing their research on just such a metal – a compound of magnesium and aluminum – and had given the resultant material the name of *Luftschwamm*, which translated means ‘aero-sponge’.

Let us assume, then, that by early 1945 the Germans had combined all the aforementioned discoveries into one complex experimental flying machine. First, we have a small flying disk known as the *Feuerball*. This disk not only spins around its vertical axis, but automatically follows its target, makes its target’s ignition and radar malfunction by filling the vicinity with a gas that when burning creates a damaging magnetic field, then automatically flies away when attacked.

Now let us enlarge this flying ‘fireball’. The new, enlarged disk will also spin on its vertical axis, but with the addition of direct gyroscopic

stabilization, a pilot's cabin can now be placed on that axis, with the main body – or engine – of the disk spinning around the cabin. We then add to the enlarged, pilot-carrying disk a form of radio that can cancel at the pilot's discretion the return signals, or blips, from the enemy's radarscope and thus render our flying disk undetectable to the enemy. Next, we have electromagnetically or electroacoustically controlled firing weapons, we have cannons that spit ignition-damaging gas instead of shells, we possibly have various laser or pulse-beam weapons, and we have devices that insure that our flying disk will automatically retreat from enemy attacks. Add to all this the fact that the disk is made of an alloy that can withstand enormous pressure and a temperature of one thousand degrees Centigrade and that, being porous, can take the air in like a sponge and then use it to enhance its own propulsion to almost unbelievable speeds… Add it up and what do we have? What we *might* have is the German *Kugelblitz*, an offspring of the *Feuerball*, a piloted machine in which a single mass of wing, tail and fuselage is formed into one gyroscopically stabilized, vertical-rising, possibly supersonic flying disk.

Did such a machine exist? I think it might have. What I *do* know is that a machine very much like it, and called the *Kugelblitz*, was reportedly test-flown sometime in February 1945, in the area of the underground complex at Kahla, in Thuringia, that the test was marked as successful, and that from incomplete notes found in the Kahla complex when the Allies took it over, that machine reached a height of about forty thousand feet at a speed of approximately twelve hundred and fifty miles per hour.

Regarding the possibility that what we found in Germany was later utilized by the Allies, I can only point out that shortly after the war the British and the Canadians between them began to develop some revolutionary kinds of aircraft that were rumored to be based on designs discovered in Germany after its collapse. Included in these were the Armstrong Whitworth Aircraft Company's AW-52-G all-wing glider and the AW-52 Boomerang – both of which were similar in appearance to the German 'flying wing' designs and, incidentally, to the enormous 'flying wing' seen over Albuquerque in 1951. Also, during that same period, there was much talk in British and Canadian aeronautical circles about research into 'porous' metals and vertical take-off jet planes – and, of course, there were a remarkable number of UFO

sightings. Finally, as you yourself have reminded me, both the Americans and the Canadians made numerous mentions of official flying saucer projects. From all this, Dr Epstein, I think you can draw your own conclusions.

Chapter Thirty

The noon sun was scorching, the humidity suffocating. The river rippled and flashed, curving away in the distance, shadowed by the conifer trees and the banks of reddish mud as the sun beat down on the forests, on the creaking gunboat, draining Stanford and making his eyes sting as he clung to the railing. He could scarcely grasp where he was, had lost track since his arrival, stunned by the heat, by the stifling humidity, alienated by the noise and dusty streets of Asunción, now gazing across the Paraguay River and wondering where he was going. Stanford normally enjoyed the heat, had grown up with it, was used to it, but here, on the gunboat, the forests looming across the river, the heat was unearthly, unreal, totally monstrous, a sodden heat that clamped all around him and threatened to choke him. Stanford took off his hat, wiped the sweat from his forehead, put the hat back on and glanced about him, his clothes soaked, his boots burning.

'Have a beer,' *Señor* Stanford. It will help cool you down. You must not let the sun dehydrate you. You need plenty of liquid.'
Juan Chavez was smiling, a sly, gap-toothed grimace, his dark eyes as unrevealing as the forests slipping past the gunboat. Stanford nodded and took the beer, the bottle cold in his sweaty hand. He drank and wiped some foam from his lips, stared uneasily at Chavez.
'How much longer?' he asked.
'Not long, *señor*.' Chavez grinned and the spat over the railing, his open shirt fluttering.
'*How* long?' Stanford asked.
'Not long,' Chavez repeated. 'Five, maybe ten or fifteen minutes. It is just around the bend in the river. It will not take much longer.'
Stanford gazed along the river, saw it curving around the line of trees, flowing lazily, rippling out around rocks, slashed by sunlight and shadow. The sight of it chilled him, made him feel more unreal, filled with foreboding and with vague, nameless fears that lanced through him for no

apparent reason and drained him of courage. He despised himself for it, tried to fight it, failed repeatedly, tumbled back into fear and confusion like a child having bad dreams. In a sense that's what it was – he recent recollections were all nightmarish: the strange 'boys' outside the ranch, the 'suicide' of Scaduto, Epstein willingly clambering up the darkened hill and not seen since that evening. Stanford felt crushed by it all, dogged by incomprehension, dreaming frequently of the lights that pulsated and merged, and then awakening to an alien world in which nothing was constant… And now here he was in Paraguay, the sun blinding him, the heat draining him. He had been on the shuddering gunboat for four or five hours, passing banks of reddish mud and sleazy waterfront cafés and dense forests that soared on either side and seemed to be totally impenetrable. Stanford coughed into his fist, trying to clear his dry throat, raised the bottle to his lips and drank some more, seeking some kind of solace.

'Good,' Chavez said. 'You must drink. You must never dehydrate.' He was eating from a cone of paper, dipping into it with his fingers, and he grinned and held the cone out to Stanford, his brown eyes faintly mischievous. 'Here, *señor*,' he said. 'You must eat as well as drink. You should have some *camarónes*.'

Stanford fought back his revulsion. 'No, thanks,' he said. 'I can just about stomach this beer. I don't think I can eat.'

'You are feeling ill, *señor*?'

'Not really,' Stanford said.

'Ah, yes,' Chavez said. 'This stinking boat. And the heat… You're not used to it.'

Stanford didn't reply. He gazed around the crowded gunboat. The Ache Indians were still crouching at the aft end of the desk, small, emaciated, their narrow eyes dulled by dread, dressed in rags and huddling close to one another as if for protection. Two *Federales* were guarding them, wearing jackboots, holding rifles, both gaunt-faced and bored, chewing gum, their mean eyes hooded beneath peaked caps. Stanford studied them at length, feeling helpless and ashamed, recalling how the Ache Indians had been herded onto the boat after being abducted from a village some miles back. They were being sold into slavery. They would end up in Bolivian tin mines, in the ranches of Boqueron, in the brothels of Argentina and Brazil, in the cotton fields of Guatemala. Stanford felt shame when he thought of it. The eyes of the women and children haunted him. He turned away and

gazed along the muddy river, drinking his beer, soaked in sweat.
'This is your first time in Parguay, *Señor* Stanford?'
'Yes,' Stanford said.
'You must get used to these things,' Chavez said. 'You must not be upset by them.'
'I won't get used to them,' Stanford replied. 'I won't be staying here long enough. Once I speak with the German I'm leaving. I won't get used to anything.'
'You disapprove,' Chavez said.
'That's right: I disapprove.'
'Disapproval is a luxury,' Chavez said. 'An American luxury.' He grinned and glanced about him, his jaws working on *camarónes*, drank some beer and then looked back at Stanford, his brown eyes still mischievous. 'You know the German?' he asked.
'No,' Stanford said.
'It is very strange, *señor*,' Chavez said, 'that you should know he is here.'
'Why strange?' Stanford asked.
'The German doesn't have many friends. He has been here in the forest for thirty years and is a man of great mystery.'
'That's not unusual,' Stanford said. 'There are a lot of Germans here. They own and operate the *estancias* and are all well protected.'
Chavez grinned broadly. 'You do us wrong, *señor*. These rumors about us harboring Nazis have no basis in fact.'
'Really?'
'Really.'
'Bullshit,' Stanford said. 'Your whole economy is based on slavery and drugs – and on harboring Nazis.'
'Lower your voice, *señor*.' Chavez's eyes flicked left and right. 'It is not wise to speak of such things in so open a manner.'
'I'm an American,' Stanford said.
'That wouldn't help you, *señor*. The *Federales* are devoted to General Stroessner and would not make allowances.'
Stanford glanced past Chavez and saw the lounging *Federales*, most of them lingering around the rusty gunmounts, chewing gum, smoking cigarets. Stanford didn't like the look of them. They looked simple-minded and brutal. They had Kalashnikov rifles slung across their shoulders, and their jackboots, which were covered in mud, made him think of the Nazis.

‘Okay,’ Stanford said. ‘What’s *your* connection to the German? Note: I didn’t call him a Nazi. I’m a very good tourist.’
Chavez grinned and shrugged. ‘The Ache,’ he said. ‘I round up the Ache and deliver them to the German, and he gives me a percentage of what he makes on the ones that he sells on.’
‘And what happens to the ones he *doesn’t* sell?’
Chavez grinned again. ‘At our worst, we are patriotic. The Ache are vermin, filthy and diseased; they cannot look after themselves and they cause us much trouble. So, if they cannot be sold, we look after them in other ways…’
‘You exterminate them,’ Stanford said.
‘A harsh word, *señor*. Let’s say we put them out of their misery and leave it at that.’
Stanford finished his beer, threw the bottle overboard, watching it glinting as it bobbed briefly in the river before finally sinking. He glanced again at the Indians, huddled pathetically on the deck. He tried to reconcile this world with the one he had come from: with the pilots and astronauts and the control towers of NASA, with the jet planes and the space probes and the orbiting satellites, with the UFOs that haunted man’s thoughts and mapped out his future. He couldn’t reconcile the two. This river carried him through history. The gunboat and the forest, the *Federales* and the Indians, all existed in a primitive, frozen past far removed from the modern world. But what *was* the modern world? It was what he had come from. It was a world of technology, of relentless, searching science, racing blindly into a future not yet even imagined, a future in which men would be numbers and facts would rule feelings. Yet was that such a bad thing? Stanford felt sure that it was. He looked at the squatting Indians, saw them bought and sold as meat, and then wondered if the future conjured up by the man called Wilson would in any sense be better than this: less cruel, more just. No, it would not be. The human lot would not improve. The cruelty and injustice and inequality would remain, changed only in their areas of distribution and in who would most suffer. The advances of science ignored this fact. The two worlds were all too similar. The future being created by Wilson, and represented by his technology, was as cruel and emotionally primitive as the world this gunboat was moving through.
Stanford shivered and looked ahead. The river curved out of sight. He saw a jetty thrusting out from the riverbank, the water rippling around it.

‘There it is,’ Chavez said. ‘Your journey is ended, *señor*. You will soon feel the ground beneath your feet – and can talk with your German friend.’
‘He’s not a friend,’ Stanford said.
‘My apologies, *señor*. A man like you would not have such friends. Your appearance confirms this fact.’
Stanford ignored the sarcasm, his eyes fixed on the wooden jetty, watching intently as the boat approached and the waterside village slid into view, thrusting out from the tangled reeds and liana at the edge of the forest. There were people on the jetty, men in filthy fatigues, looking suspiciously like *contrabandistas*, pistols stuck through their belts. The boat growled and shuddered, turning in toward the village, inched forward and then bounced against the tires along the jetty’s walkway. Stanford glanced back over his shoulder. One of the Ache women was wailing. A *Federale* slapped her brutally on the face and bawled a stream of abuse. The woman’s wailing became a whimpering. Stanford flushed and turned away. One of the crew had thrown a rope to a man on the jetty and this man was tying the rope around an upright, bending low, shouting something. The boat’s engine cut out. A few member removed the gate. A plank was thrown across the space between the deck and the jetty’s walkway, then tied to some flaking uprights to form a crude gangplank. Stanford moved toward the plank, wanting desperately to disembark, but Chavez tugged at the sleeve of his shirt and motioned him back.
‘No,’ he said. ‘First the Ache.’
Stanford stopped and stared at him, saw the sly, gap-toothed grin, stepped back as Chavez went to the *Federales* and bawled his instructions. The *Federales* were quick to move, venting their boredom on the miserable Indians, screaming abuse and kicking them to their feet and herding them toward the makeshift gangplank. The Indians were not so quick, weak from hunger, confused, and the *Federales* encouraged them along with vicious blows from their rifles. The women wailed and hugged their children, cowering away from the rifle butts, while their menfolk, uncommonly small and frail, tried in vain to protect them. Stanford had to stifle his rage, turning away and surveying the gangplank; he saw the first of the Indians stumbling across it with their hands on their heads. Chavez was leading them down, his shirt unbuttoned and flapping loosely, his broad hat tilted over his eyes, keeping off the fierce sunlight. Stanford burned and looked away. He let his gaze roam over the village, a drab collection of leaning

huts made from palmetto trunks and vines, hogs and goats sniffing lethargically at the dust, babies lying on corn shucks. The poverty was total, the old and young emaciated, sunlight falling on scattered gourds and woven baskets and banana leaves, on the giant rat that raced across the clearing and disappeared into the forest. Stanford glanced along the jetty. The last of the Ache had just stepped off it. They were now at the edge of the clearing, the *Federales* surrounding them. Chavez waved both his hands. He was signalling to Stanford. Stanford choked back his rage and crossed the gangplank, glanced down once at the muddy, oil-slicked water, then stepped onto the jetty.

One of the nearby men approached him, a big man, broad and muscular, a pistol stuck behind his belt, a knife bouncing against his hip, his shirt open to expose a hairy chest, his trousers tattered and greasy.

'The *Americano*?' he asked.

'Yes,' Stanford said.

'You speak Spanish?'

'No,' Stanford said.

'Okay. Come with me.'

'You're from the German?' Stanford asked.

'You have no luggage, *señor*.'

'I don't intend staying,' Stanford said. 'All I need is in here.'

Stanford indicated his shoulder bag. The big man just stared at him. He had narrow eyes and juicily fat lips and his head had been shaved.

'Okay,' he said. 'I see. Come with me.'

'You're from the German?'

'Yes.'

'Where is he?'

'Over there.' The man pointed impatiently at the village. 'Let's go. He expects you.'

They made their way along the jetty, past the staring *contrabandistas*, the air stinking of urine and sewage and diesel fuel, the sun glinting off the oil in the river, off pistols and knives. Stanford took note of the weapons, could scarcely credit the sheer amount of them, had the feeling that he was in a war zone, death ready to pounce on him. This thought heightened his tension, swelled his feeling of unreality, and he blinked and wiped more sweat from his face, tried to keep his head clear. The big man was just ahead, the knife bouncing against his hip, stepping down into the dust of the

clearing, chickens scattering around him. Stanford followed him down, feeling drained and exhausted, breathing dust, the heat burning his exposed skin, the light hurting his eyes.
There were two trucks in the clearing, their paint flaking, revealing rust, and the Ache Indians were now grouped just in front of them, being prodded and poked. The Indians were being examined. The *Federales* were watching them. A tall man in gray slacks and white shirt was walking to and fro, studying them. This man was very thin, almost cadaverous, brown eyes in a sunburnt brown face, brown hair graying and thinning. He did not touch the Indians, merely studied them with distaste, standing back while Chavez extolled their virtues, showed their teeth, stripped their clothes off.
'*Quatsch*!' the tall man sneered. 'This is rubbish you bring me. Old men and sick women and children, not worth ten *guaranis*.'
Chavez spluttered his protestations, his hands waving histrionically, then he stripped the blouse off a woman's shoulders and held her breasts high. The woman's narrow eyes widened, filled with fear and dreadful shame, when Chavez jiggled her breasts in his hands as if bouncing two rubber balls.
'Look, *señor*,' he said. 'They are ripe and filled with milk. Still a good breeder, *señor*. And so soft, *señor*. Soft!'
'*Dreck*!' the tall man sneered. 'They are unclean and diseased. They are not fit to work in the fields. You should bury them now.'
Looking at the Indians, Stanford saw their humiliation. He shook with fury and then studied the tall man and wanted to murder him. Chavez glanced over his shoulder, saw Stanford, grinned slyly, then pointed in Stanford's direction and whispered to the tall man. Stanford stepped forward. The tall man came toward him. They stopped about a foot from one another, the dust drifting between them.
'You are Stanford,' the tall man said.
'Yes,' Stanford said.
'You have the money?'
'I have half the money. The rest is in Asunción.'
'You don't trust me,' the German said.
'I can't afford to,' Stanford said.
'Good,' the German said. 'That is intelligent. I cannot deal with fools.' He grinned bleakly and turned aside, looked at Chavez, waved at the trucks.
'All right,' he said, 'I have no choice but to accept them. Put the *schweine* into the trucks and drive them out of my sight.'

Stanford was enraged, but knew he had to control himself. There was nothing he could do for the Indians; not now and not ever. Still, it made him burn. He heard the bawling and saw the blows. The *Federales* punched the Indians, thumped them brutally with their rifle butts, forcing them up into the rear of the trucks, the women and children all wailing. The tall German hardly saw this. He was negotiating with Chavez. Their hands were waving and they were shouting at each other and then they reached an agreement. They actually shook hands. Stanford thought that ridiculous: a travesty of civilized behaviour. The trucks roared into life and churned up the reddish dust and rumbled out of the clearing. Stanford glanced around the village. The huts were primitive and filthy. Hogs and goats wandered freely, infants sucked at sagging breasts, Indians squatted around fires of glowing ash, staring at him with dulled eyes. Chavez waved at the tall German. He then walked up to Stanford. He stopped to offer his sly, gap-toothed grin, his brown eyes still mischievous.

'Keep your eyes and ears open,' he whispered. 'Adios, *compañero*!'

He sauntered back to the gunboat, his shirttails flapping behind him, as the German walked up to Stanford, his gaunt face dark and sweaty.

'So,' he said, 'you came.'

'Yes,' Stanford said, 'I came.'

'And how do you like Paraguay?'

'I'm not wildly impressed.'

The German laughed at the remark, a high-pitched, barking sound, then the laughter turned into a ragged coughing that made his whole body shake. He cursed and turned aside, covered his mouth with a handkerchief, kept it there until the coughing had subsided, then wiped blood from his lips.

'*Scheisse*,' he hissed dramatically. 'This filthy forest is killing me. I must return to Europe as soon as possible for some civilized care.'

'Germany?'

'Where else? I need a competent doctor. The Paraguayans have the surgical skills of butchers. I would not let them touch me.'

'I thought you liked it here,' Stanford said. 'I mean, you've been here for about thirty years.'

'Not by choice,' the German said. 'As you well know. I do not require your sarcasm.'

He stared steadily at Stanford, his dark eyes hard and searching, then he sniffed and turned his gaze on the large man who had brought Stanford to

him. The large man moved forward slightly, his knife and pistol flashing, and stopped when he was right beside Stanford, his thick arms dangling loosely.
'This is Atilio,' the German said. 'He's from Argentinia. He is now what we call a *cuchillero*, and is very reliable.'
'What's a *cuchillero*?' Stanford asked.
'A knifer,' the German said. He turned his head and glanced around him, his lips curling in visible distaste at sight of the village. '*Diese Halunken*,' he hissed. 'Unbelievable. Come. Let us go.'
He led them across the clearing, scattering children and chickens, Atilio right behind him, Stanford just behind Atilio, their feet kicking up the reddish dust, the fires smouldering on all sides. The fires were not for warmth. The Indians were roasting sweet potatoes. The German glanced down and spat on a fire as he passed the drab huts. He stopped at the edge of the forest. The trees shadowed a parked jeep. The German took a back seat, Stanford clambered in beside him, then Atilio sat behind the steering wheel and turned on the ignition.
'Where are we going?' Stanford asked.
'To my compound,' the German said. 'You want information and shall have it, but I must have my comforts. It is not too far away. Ten kilometers from here. I feel safer when I'm deep in the forest where the planes cannot see me.'
The jeep roared into life, churning up soil and stones, lurched forward and headed into the forest where the trees kept the sun out. Stanford expected it to be cooler, was shocked to find that it wasn't: the humidity was much worse, overpowering him, making him feel suffocated. He glanced around him, seeing a riot of vegetation, tangled vines and soaring trees in a chattering green gloom, isolated shafts of sunlight beaming down on the steaming banana leaves. The narrow track was very rough, hacked out by hand and pitted with potholes, winding left and right between the trees and disappearing ahead of them. The tall German said nothing. Stanford glanced sideways at him. The German skeletal, his cheekbones too prominent, his gelid eyes buried deep in his head, his lips thin and disdainful. The jeep coughed and rattled, bouncing up and down a lot, going through the shafts of sunlight that bored down through the trees and illuminated the steaming vegetation. Stanford felt suffocated. He was sweating and feeling feverish. He glanced again at the German, saw his dark, remote eyes, took a deep

breath and licked his parched lips and wished the journey would end.
‘So,’ the German said. ‘You want to know about the saucers. You have come a long way for your information. You must want it badly.’
‘I brought the money,’ Stanford said. ‘I want it that much.’
‘Why?’ the German said. ‘Why this interest in the saucers? Everyone wants to know about the saucers, but it does them no good.’
‘You’ve had others?’
‘Of course,’ the German said. ‘Did you think you were the first to locate me? Such vanity, *mein Herr*!’
The German laughed at his own joke, the same high-pitched, barking sound, and again the laughter turned into a coughing that made him split blood. He cursed and wiped his lips, shook his head and muttered something, his thin body being jolted by the jeep as it bounced over the rough ground of the forest.
‘How many others?’ Stanford asked.
‘Just a few,’ the German said. ‘Three or four over the past ten years or so – all wanting the same thing.’
‘Who were they?’ Stanford asked.
‘Men like you,’ the German said. ‘Men with a great need to know, two Americans, a Russian…’ The German coughed again and cursed softly. ‘It will do you no good,’ he said. ‘Those who know what I know will not admit that it’s true; those who don’t know would refuse to believe it… It will do you no good.’
Stanford didn’t reply. He thought the German might be right. He looked around the forest, at the steaming vegetation, saw striations of light in the gloom and felt as if he were dreaming. Then the jeep burst into sunlight: into a clearing in the forest. Lines of barbed wire formed a fence around a large wooden building, its sloping roof covered in vines and banana leaves, supported by planed tree trunks. The jeep skidded to a halt. Clouds of dust swirled up around it. Stanford coughed and covered his eyes with his hands until the dust had settled down again.
‘*Sehr gut*,’ the German said. ‘We are home. I live humbly, *mein freund*.’
Stanford followed the German down, the dust settling around his feet, the heat monstrous, pouring down upon the clearing as if through a huge sheet of glass. He rubbed his eyes and checked the clearing, saw the curved line of the trees, the large, L-shaped building, a wooden house, directly in front of him, surrounded by more barbed wire. The compound was busy, filled

with Indians and *cuchilleros*, the latter keeping watch on the former, their guns and knives threatening.
'The barbed wire is electrified,' the German said, 'so make sure you don't touch it. Over here. Come this way.'
They walked across a stretch of ground, past the Indians and *cuchilleros*, reached the house and climbed a few wood steps to a porch protected by a thatched awning. There was a table and some chairs. An Ache woman stood by the table. She was wearing a red blouse and long black skirt, a towel draped over her right arm. She bowed low to the German. He simply grunted and sat down. He waved languidly at Stanford who joined him at the table, which held a bottle of brandy and two glasses, a clay cup full of wriggling worms. The worms were white and fat. The German reached over and picked one up. He bit its head off and held it up and said, '*Koro* worms! Try one.' Stanford shuddered and shook his head, saying, 'No.' The German chortled and swallowed the worm. He put his feet up on a stool and the Ache woman went down on her knees and laboriously pulled off both his boots and wiped his bare feet with the towel. When this was done, she moved backward. She did not get off her knees. The German barked a command and the woman stood up and filled the two glasses with brandy. Stanford watched her, saying nothing. The German clapped his hands. The woman bowed and disappeared inside the house, her bare feet making squelching sounds.
'So,' the German said, 'we are home. We are relaxed. We can talk.'
He picked up his glass, sipped some brandy, set the glass down, stared at Stanford with a humorless smile that made Stanford's flesh creep. Stanford picked his own glass up, drained it dry, set it down, then he pulled the leather bag from his shoulder and placed it between them.
'Your money,' he said.
'And the rest?'
'When we've finished our business here to my satisfaction, one of your men can escort me back to Asunción and I'll give him the other half.'
'You might not do that,' the German said.
'Then your man will kill me,' Stanford said.
'Good,' the German said. 'You understand that. This makes me feel better.'
He finished his brandy, refilled both glasses, then leaned back in his chair and offered Stanford that humorless smile.
'There's something else,' Stanford said, wiping the smile from the

German's face. 'I didn't just come for information. I also want proof.'
The German straightened up, then leaned forward to stare at Stanford with steely, barely concealed anger.
'Proof?' he said quietly.
'You heard me,' Stanford said. 'I know for a fact that you can prove it – and that's what I'm here for.'
The German stared at him for a long time, hardly moving, expressionless, then his lips slowly curled into a smile as he sat back in his chair.
'We have a jungle up north,' he said.
'I know that,' Stanford said.
'That jungle is hell,' the German said. 'You can take it or leave it.'
Stanford pushed his chair back, took his glass and stood up, then went to the leaf-covered railing and looked over the compound. The sun was sinking behind the forest, the sky violet and serene, the conifers and cypress silhouetted as twilight descended. A faint breeze stirred the dust up, blew it lazily across the barbed wire, let it drift around the Indians and *cuchilleros*, their shadows stretched out and merging. Stanford studied the forest. It seemed dense and somehow threatening. Stanford shivered and turned away, let his rage defeat his fear, then grinned and held his glass up to the German in a mock salute.
'Here's to hell,' Stanford said.

They moved out the next morning, in the dawn's bloody haze, heading into the forest, following a narrow, dwindling path, shafts of crimson light boring through the gloom between the dense, soaring trees. The Ache beaters were out ahead, their machetes hacking and slicing, clearing a path for the short line of men stretched out behind them. Stanford marched beside the German, the huge Atilio protecting both of them, a few disheveled *cuchilleros* behind them, their guns and knives rattling. The forest was still cold, the dew glistening and dripping, the leaves underfoot damp and treacherous, branches whipping and spitting. The forest rustled and chattered. Stanford heard it and loathed it. The morning sun was fighting to break through and bleed into the chilling gloom.

' *Sehr gut*,' the German said. 'A good morning. It will soon be less cold.'
Stanford marched with some care, a small pack on his back, feeling cold and almost ill from lack of sleep, still not fully awake. He had slept in the

German's house. The German's snoring had tormented him. He had tossed and turned uncomfortably on the hammock, the sounds of the forest in his ears. The forest never slept. The long night had taught him that much. He had heard jagged cries, staccato cackling, distant growling, the leaves rustling with a life of their own, the ground shifting and sliding. It was not much different now. Stanford glanced nervously around him. He saw tangled vegetation in the gloom, heard more unfamiliar, troubling sounds as his boots sank in mud. He did not like it one bit.
'How long will it take?' he asked.
'All day,' the German said. 'It is a very long hike, my American friend, and will possibly wreck you.'
'I'll make it,' Stanford said.
'I'll make sure of it,' the German said. 'You are good for the second half of the money and that makes you worth helping.'
Stanford tugged at the pack straps, felt the tingling of his skin, sweating even in the chill of morning, dreading the heat yet to come. He saw Atilio just ahead, his gross hips rolling rhythmically, a pistol and a couple of knives stuck down behind his broad belt. The forest seemed to be endless. It grew deeper and darker. The path dwindled away to nothing, disappeared, and the forest closed in on them. Stanford fingered his pack straps. His shoulders had started aching. He looked ahead and saw the machetes of the Ache beaters hacking down the tangled liana and banana leaves. Stanford felt tired already, heard the rasping of his lungs. He glanced resentfully at the German, saw his gaunt, weathered profile, and wondered how that frail, gangling body could endure such punishment.
'You are with us?' the German asked.
'I'm still here,' Stanford said.
'*Sehr gut*,' the German said. 'You must suffer. It is part of your penance.'
'What penance?' Stanford said.
'Why ask me?' the German retorted. 'But a man does not come to this place just because of the saucers.'
'That saucers are a mystery.'
'And you came here for a mystery?'
'I came because I lost a couple of friends and I want to know why.'
The German nodded and grinned. 'Ah,' he said, 'I see. And those friends were involved with the saucers. *Ja*? Am I right?'
Stanford didn't reply. He didn't want to think about it. The forest chattered

and slithered on all sides, and he felt his flesh creep. He would never find the answers. There were too many questions. He tried to think, but the sweat dripped into his stinging eyes and reduced him to pettiness. All right, think: he would think. He thought of Epstein in the mountains. He closed his eyes and saw the blackness rushing at him and exposing the stars above. His old friend had gone away. The months since then had not been pleasant. During the day, at night, whether awake or deep in sleep, he had suffered the dreams of those who knew that they were haunted and lived with their helplessness. Stanford knew he was being followed. He didn't know, but he was certain. Yet each time he tried to think objectively about it, he collapsed into what seemed like paranoia. He now understood paranoia. He knew what the frightened felt. He had turned into an old man overnight and might never recover. Stanford fingered his chafing pack straps. He glanced nervously around him. The forest rustled and slithered with alien life forms that did not offer comfort.

'Your friends disappeared?' the German said.

'Yes,' Stanford replied.

'That is not so unusual,' the German said. 'It happens here all the time.'

'You mean the Ache,' Stanford said.

'Just so,' the German said. 'The Ache disappear in their hundreds, melting into the trees.'

'You do it,' Stanford said. 'You make them disappear. You sell them or use them as slaves and then you bury them deep.'

'You disapprove,' the German said.

'Damned right, I disapprove.'

'You're a guilt-ridden American,' the German said, 'and your conscience is easily pricked.'

'Fuck you,' Stanford said.

'*Sehr gut*,' the German said. 'Nevertheless, there are many disappearing that we cannot account for.'

'*Wunderbar*,' Stanford said.

'I am serious,' the German said. 'The Ache disappear too fast. We cannot account for their numbers and the saucers are blamed for it.'

The came out of the forest. A broad savannah stretched before them. Stanford blinked and felt an awful blast of heat that almost sucked his lungs dry. He rubbed his eyes and looked ahead, saw a sea of waving grass, a few barren trees here and there, the sky white, the sun dazzling. Stanford felt

that he was melting. He drained down into the earth. He stared across the sea of grass, saw it shimmer and undulate, and longed for the comforts of a city and its seductive parameters. He fingered his chafing pack straps, licked his parched, cracking lips. The heat was monstrous and it closed in around him and make him gulp like a drowning man.
'Beyond that is Boqueron.' The German spoke with calm indifference. 'It sits between Argentina and Bolivia and Brazil, and within it is the jungle I mentioned – a place to avoid.'
'But that's where we're going,' Stanford said.
'You will remember it,' the German said, 'for as long as you live. What you want is hidden deep in the jungle, and you must pay the price.'
The German seemed pleased. He smiled at Stanford as he moved on. Stanford gulped and felt the heat burning through him as he stumbled ahead. The air was hot and clammy. He put on his sunglasses. The Ache Indians were already in the savannah, their machetes flashing in sunlight. Stanford marched beside the German. The huge Atilio was just ahead. The *cuchilleros* were moving out around them, hacking at the tall grass. The sun blazed down on the grass, on the scattered, scorched trees, turned the sky into a sheet of white steel that radiated tremendous heat. Stanford tried to think clearly, but his thoughts slipped and slid in wild abandon, as if out of control… Epstein clambering up the hill. The black sky peeling back. The dark globe shrinking high in the sky, flaring up, disappearing… He was doing it for Epstein. He would not let Epstein go. He would not be defeated by Wilson and his fellow conspirators… Stanford wiped sweat from his brow. He was waist-deep in the grass. The sea of grass shimmered and stretched away to a silvery haze.
'The Ache,' Stanford said. 'What do you mean, they disappear? You said you can't account for their numbers. What do you mean by that?'
'They disappear,' the German said. 'We are not the ones taking them. We go to their villages, we find the huts empty, we search the surrounding forest and find nothing… They have just disappeared.'
'Other traders?' Stanford suggested.
'No,' the German said. 'We all know each other quite well – and we all suffer the same thing. The Ache are not removed by traders. Such abductions would be impossible. Paraguay is a very small country and is strictly controlled. The Ache disappear in their hundreds. They disappear overnight. The only way out is along the river, but they've never been seen

there.'
'Airplanes?' Stanford suggested.
'They can't land in the forests. *Nein*, it cannot be airplanes, so we believe it's the saucers.'
Stanford heard the rustling grass, felt it brushing against him, had visions of the life beneath his feet, of poisonous snakes and giant rats. He shivered and kept going, trying not to look down, the muscles tightening in his belly, the sweat pouring down his face, the dark glasses inadequate protection against the sun's fierce white glaring. The grass snapped and broke around him. The Aches' machete blades were flashing. The *cuchilleros* formed a loose protective circle, their knives and guns rattling. Stanford felt that he was dying, his breath burning in his lungs. The pack jumped up and down on his shoulders and made his whole body ache.
'Many saucers,' the German said. 'We see the saucers all the time. They come down on the Chagres, on the Gran Chaco and the Mato Grosso, and afterward all the Ache have disappeared and are not seen again.'
'The saucers *land*?' Stanford asked.
'*Ja*, they land,' the German said. 'They descend into the forests. They descend where there is nothing but swamps, and yet they always take off again. They must hover above the swamps. We cannot explore such areas. But they appear to descend over the swamps and take the Ache away.'
The sweat poured down Stanford's face, soaked his armpits and body; his feet were burning in the canvas jungle boots, his throat dry, his head tight. He tried to think of the reports, shook his head, tried again… dark skin, narrow eyes, uncommonly small, Oriental… the most common characteristics as described by numerous contactees. Such descriptions fit the Ache. They were small and Mongolian. Stanford struggled through the tall grass, exhausted and half blind, the muscles in his belly growing tighter with excitement and tension.
'You feel good?' the German asked.
'I feel rotten' Stanford confessed.
'You're an American,' the German said. 'That means you're weak. You should thank me for this.'
'Thanks,' Stanford said.
'Don't thank me,' the German said. 'Just stay on your feet until we get there. It is still a long way.'
The savannah seemed endless, a rustling, yellow sea, the tall grass bending

under Stanford's feet, springing back up around him. He secretly blessed the Ache beaters. Their machetes flashed in the sunlight. They worked hard and the sweat soaked through their shirts and streamed down their dark faces. Here and there were lonely trees. The blazing sky was a white sheet. The air was hotter than ever and more humid, suffocating, a giant glove slipping over him. Stanford wiped sweat from his eyes. His shirt was sticking to him. The light shimmered and distorted the waving grass and played tricks with his vision. He blinked and licked his lips. Pains were darting up his legs. The heat swam all around him, burned his skin, sucked his lungs dry; the brightness of the sky was overwhelming, a vast, silvery furnace.

One of the Ache Indians screamed, waved frantically and fell, disappearing into the rustling, waist-high grass while the others all scattered. Atilio cursed and raced ahead, tearing his pistol from its holster, a knife jumping up and down on his left hip, the grass parting before him. Confused, Stanford stopped walking. He heard the screaming of the Indian. Another Indian raised his machete above his head and swung it down into the tall grass. The hidden Indian kept screaming. Stanford shrank from that dreadful sound. The German muttered and rushed up to join Atilio, the *cuchilleros* surrounding him. Atilio bawled and waved his pistol. Stanford caught up with the German. They both stopped beside Atilio and looked down at the Indian on the ground. He had been bitten by a snake. He was wriggling dementedly and shrieking. Another Indian stood beside him, his machete dripping blood, the snake's amputated head at his feet, the headless body nearby.

'*Scheisse*!' the German hissed. 'We have no time for this. Finish the Indian.'

It was over quickly, Stanford hardly knew what was happening. He saw the Indian on the ground, pouring sweat and shivering badly, holding on to the leg that had been bitten and now moaning pitifully. Then Atilio knelt down, grabbed the Indian by the hair, jerked his head up and poked it with the pistol and then pressed the trigger. The sudden bang made Stanford twitch. He saw the Indian's head jerking. Blood and bone splashed on the ground beneath the head, and then the head itself fell. Stanford blinked and looked again. Atilio stood up and blocked his view. Atilio bawled at the watching *cuchilleros*, who then turned on the Indians. They were all shouting at once as they pushed the Indian onward. The Indians moved out and swung their machetes, again hacking a pathway through the tall grass. The *cuchilleros*

formed a circle. Atilio marched out in front. Stanford looked down at the ground, saw the snake's dismembered head, saw the brains of the dead Indian spilling out, his eyes glassy, his arms outstretched. Stanford blinked and licked his lips. He hurried after the marching German. The *cuchilleros* closed in on both as the grass swayed about them.
'You had him killed!' Stanford said.
'*Ja*, that is correct.'
'He could have been saved,' Stanford said.
'We haven't the time, *mein freund*.'
'What does *that* mean?' Stanford asked.
'Be quiet,' the German said. 'We couldn't have carried him. It is too hot for that.'
'You bastards,' Stanford said.
'*Sehr gut*,' the German said. 'At least you still have enough energy to show your resentment.'
'It was a swinish thing to do.'
'You are here of your own free will. That makes you a collaborator, *mein freund*, so don't offer me pieties.'
Stanford couldn't deny it, felt ashamed, kept his mouth shut, bent forward and pushed against the tall grass, wondering when it would end. The sun crossed the burning sky. The heat increased and dissolved him. He bled down through himself, through the earth, and lost touch with reality. The machetes flashed up ahead. The *cuchilleros* surrounded him. Atilio marched on in front, his hips rolling, his gun and knives jangling. Time slowed and then stood still. Stanford tried to stop thinking. The white sun started sinking in the sky, became gold and then violet. Stanford saw the yellow sea. He blinked and looked again. There was a dark line between the sea and sky and he wondered what it might be. A sea: a yellow sea. Not a sea: a scorched savannah. Stanford blinked and saw the dark line as a snake that crossed the frame of his vision. He heard the snake and felt it. He tried not to look down. He thought of the *capibara*, the giant rats, and a severe chill cut through him. He shuddered, but kept walking. The German was still beside him. The German's gaunt profile was hazed in silvery light; the yellow sea was the tall grass. The sun shifted in the sky. It sank lower, turning purple. The dark line divided the grass from the sky and took shape as a forest. Stanford almost sobbed with joy. He felt as if he were on fire. He was burning and his body seemed hollow and drained of all feeling.

‘There it is,’ the German said.
‘Thank God,’ Stanford said.
‘You will not thank God once you are there. That’s the devil’s playground.’
Stanford tried not to listen. He didn’t want to believe it. He did not believe that it was possible to feel worse than he did now, did not believe that any place could be worse than the blistering savannah. Those trees formed a forest. Not a jungle: a forest. In there, in the shade of the trees, it would have to be cooler. Stanford felt a great joy. He followed Atilio toward the trees. The Ache beaters were out ahead, their machetes flashing, the grass snapping and falling. Stanford wiped sweat from his face. The white sky was streaked with violet. Stanford grinned and moved faster, felt the pack on his back, ignored it, ignored his exhaustion and pain, and hurried into the forest.
His spirit plunged and died. He couldn’t believe the heat was real. His lungs burned and he felt that he would drown in his own pouring sweat. He hadn’t known he could sweat so much. He wondered where it all came from. He rubbed his eyes and glanced around the green gloom, saw it steaming and glistening. Stanford felt a deep dread. Here everything was outsized: the tangled vegetation, the huge plants and quivering leaves, the crawling insects and chattering birds and monkeys, the giant rats in the undergrowth. Stanford felt his flesh crawling. He felt trapped and suffocated. The forest chattered and shrieked, hissed and growled, its steam rising in faint light. The machetes flashed in the gloom, slashing branches and leaves, the Indians ripping the shrubbery aside, their nut-brown bodies sweatslicked. Stanford choked back his sobs. He felt petty and childish. His despair was a void at his center and it threatened to swallow him. Something crawled across his foot. He glanced down and saw a spider. It was huge and ink-black, its body covered in gleaming hairs, and he kicked out frantically, almost screaming, and saw it flying away. He shuddered and wiped his brow. He saw the German smirking at him. He felt rage and the rage drove him onward and brought back some strength. A bat flew above his head. Its beating wings merged with the leaves. Stanford shuddered when the leaves brushed his face with the feel of warm slime. He cursed softly and moved faster. Tangled vines trapped his feet. He knelt down and tore the vines from his boots and saw a lot of large ants. They were devouring a dead rabbit. Not a rabbit: a giant rat. Stanford shivered and then something stung his hand and he slapped the ant off. He stood up and walked on. The forest

steamed and dripped around him. It was chattering and shrieking, alive with crawling things, that undergrowth shifting and rustling, furry forms racing back and forth.
‘You are all right?’ the German asked.
‘Yes, I’m okay.’
‘You do not look too good,’ the German said. ‘You seem a bit shaken.’
‘I’m okay,’ Stanford insisted.
‘You have tenacity,’ the German said.
‘Just get me there, you bastard,’ Stanford said. ‘I won’t crack until you do.’
The forest opened around a swamp. A crimson light poured through the trees. He saw the bones of various animals in the clearing, the swamp steaming and stinking. The Indians led them around the edge of it. The *cuchilleros* cursed and groaned. Atilio slapped one of the men on the face and then kicked him onward. Someone screamed and started sinking, his eyes wide and frightened. The slime oozed and bubbled up around his knees as he waved his hands frantically. Atilio cursed and bawled some orders and some Indians rushed toward him. They formed a chain and reached out for the sinking man and pulled him out of the mud. The man rolled onto his back, but Atilio brutally kicked him. The man yelped and jumped up and then quickly moved on. Atilio followed, bellowing orders. The forest closed in again. The heat clamped around Stanford, drenching him, suffocating him, but he choked back his nausea and stumbled on, carefully scanning the green gloom.
The forest opened out again. He saw a village in crimson light. He saw a river of blood on his left as they passed through the village. The natives stared silently at them out of dark, haunted eyes. Children played in the dust, swallowed worms, their bodies almost transparent. The *cuchilleros* ignored them, but kept pushing the Indians onward. The forest closed in again, a green gloom filled with steam, the heat monstrous, the humidity soul-destroying, the foliage shrieking and chattering.
Stanford felt that he was dead. He could scarcely recall why he was here. His body burned and was covered in slime and his felt his skin peeling. He was nothing. He was *now*. He was in and of the forest: the snake and the spider and the rat and the other teeming, unseen life. The huge leaves dipped and dripped, the vegetation hissed and steamed. He was boiling blood and aching bones and filth, but he soared above it all. The trees held him and protected him. The green gloom was his sustenance. He swallowed

bile and drank in the scalding air and rubbed his eyes and saw shooting stars. Then more gloom. Shafts of sunlight. The distant cries of the Indians. The trees parted and let him walk though and he saw streams of crimson light.

They were in another clearing. A towering cliff face blocked their way. The sinking sun was an immense bloody globe that turned everything red. The cliff face was high and jagged. The rock looked like flowing lava. The *cuchilleros* and the Indians, Atilio and the German, all were frozen in that unreal crimson haze, staring up at the wall of rock.

Stanford followed their gaze. He shook his head to clear it. He saw tree trunks and planks, tangled vines and banana leaves, all piled up to block off the entrance to a cave in the cliff face.

'This is it?' he asked.

'Yes,' the German said. 'It's a shrine. The natives worship at this shrine. And the shrine is your proof.'

He stepped forward and barked some orders. The Indians swarmed across the cliff face. The *cuchilleros* moved back and raised their rifles, not looking too happy. Stanford watched them, feeling dazed. His throat was dry and he felt ill. The Indians worked at the vegetation, pulling the leaves and vines away, removing the planks and then tackling the leaning tree trunks, pushing them over. The debris crashed to the ground. A cloud of dust billowed upward. The dust sparkled in the radiant crimson light and turned the Indians to specters.

Stanford stared through the dust. He saw the dark mouth of the cave. Stepping forward, he saw a dull, metallic gleaming behind the crimson haze. The last of the tree trunks were rolled aside. Crashing down, they raised more dust. The Indians looked at the cave with frightened eyes and then hurried away. Stanford stepped forward again. His senses suddenly rushed back. His heart was pounding when he saw the metal gleaming in the spiralling dust.

The crimson light flooded the cave. Stanford almost stopped breathing. He saw a jigsaw of coiling black lines and irregular pieces of dully gleaming metallic-gray. He stepped forward for a closer look. It was a solid metal sphere. It was about thirty-five feet wide, it swept up to a dusty dome, and the black lines were a coiled mass of snakes, all asleep on the saucer.

'Oh, my God!' Stanford whispered.

He stood there for some time. He couldn't believe what he was seeing.

There were at least a hundred snakes on the saucer, their bodies coiled and intertwined. Stanford felt his flesh creep. He saw the silverygray metal body. The perimeter swept smoothly up to the dome, making the saucer, despite the presence of the snakes, look oddly beautiful. The natives thought it was a shrine. Stanford understood their feelings. His fear departed, giving way to exhilaration. The saucer was magnificent. Its polished surface seemed seamless. It stretched across the mouth of the cave and was bathed in the crimson light.

'What happened?' Stanford asked.

'It crashed years ago,' the German said. 'The natives thought it was a gift from the gods, so they dragged it in here.'

'Was there anyone in it?'

'I think so. I assume so. But there's no way to open it up – and now the snakes keep us out of there.'

Stanford's heart was pounding. The sublime machine mesmerized him. He saw the intertwined, sleeping snakes on the dusty dome, still and silent, together forming a protective, deadly tapestry. Stanford felt himself shaking. He couldn't bear it any longer. He stepped forward, intending to walk to the saucer, determined to touch it.

A single shot rang. The bullet ricocheted off the saucer. Stanford gasped and stepped back and turned around and saw the men looking at him. Frozen in crimson light, they looked hazy and unreal. The tall German had a pistol in his hand and was waving it gently.

'Don't do that,' he said. 'Don't try to touch it. If you do, you'll soon be a dead man.'

Stanford looked at the saucer. His flesh crawled at what he saw. The snakes were all awake, slithering through one another, wrapped themselves around the dome, dangling over the edges, hissing and spitting and sliding along the smooth, seamless surface. Stanford shook even more, exhaustion finally claiming him. He stood there in the clearing, the dust billowing about him, staring through the swimming crimson haze at the snakes on the saucer.

'Your proof,' the German said. 'Now I talk.'

□

Chapter Thirty-One

‘Let me begin at the beginning. In 1933, when Hitler took power, the greater part of German science was totally subordinated to the creation of new military weapons. Thus, by 1935, research on rockets and other forms of aerial warfare had advanced by spectacular leaps. Now, the common assumption is that most of that work was being done by Walter Dornberger, Karl Becker, Klaus Reidel, Helmut Grottrup and Wernher von Braun, but such was not in fact the case. Most of the fame attached to those gentlemen resides in the fact that they all worked on the V-1 and V-2 rockets,, that the majority of them went to America after the war, and that once in America they became even more well known for their NASA work on space exploration. *Sehr gut*. However, the real pioneer of Germany’s World War Two achievements was the American, Wilson.

‘In 1935 most of the German rocket research was being undertaken at the experimental stations in Reinickendorf and Kummersdorft West, not far from Berlin. It was to Kummersdorft West, where I was then scientific administrator, that Himmler personally came to introduce Wilson. And what really astonished me, apart from the fact that Wilson was an American, was the extent of the powers that Himmler intended giving him.

‘By the middle of 1935 it had been decided that the Reinickendorf and Kummersdorft research centers were no longer big enough to house the rocket projects. That same year, Wernher von Braun had suggested using an island in the Baltic, named Usedom; this island was situated close to Szczecin at the mouth of the Oder River, and it was densely wooded, sparsely inhabited and relatively isolated. It was therefore decided to move the two research centers to the northern promontory of Usedom, near to the small village of Peenemüde… And this mysterious man, Wilson, this stranger from America, was to take over Kummersdorft West when the rocket teams left.

‘It was an unusual situation, but not as impossible as it might at first seem. While Germany was now a nation under constant surveillance, that surveillance was carried out by the Gestapo and the SS, and those organizations were strictly controlled by Himmler. Himmler’s SS were unique, a law unto themselves; they answered neither to Hitler nor to the German High Command, but only to their beloved Reichsführer, their

demigod, Heinrich Himmler. In fact, Himmler controlled Germany. He did it quietly and surreptitiously. He quietly took over schools, universities and factories, and soon he had his own research centers scattered all over Germany. Thus Himmler controlled Germany – he controlled the flow of information – and his projects were shrouded in a secrecy that would never be broken.

‘Wilson’s project was such a secret. It was known only to a few. His research centers were filled with meticulously chosen technicians and constantly patrolled by the SS. He was a genius, almost certainly. I don’t doubt it at all. He was cold and brilliant and relentless – and nearly inhuman. His sole passion was science, his knowledge beyond belief, and he rarely discussed anything but his work and the need to complete it. That’s why he was in Germany. Only Germany could meet his needs. He had limitless facilities and slave labor and Himmler’s personal support. That’s what he wanted. He didn’t care about anything else. He needed money and muscle, and he didn’t give a damn where they came from.

‘So! Given carte blanche by Himmler, Wilson quickly strengthened his project: pulling in other departments, utilizing other research centers, and stealing more technicians wherever he found them, working through the SS. Now while this had many advantages, unfortunately it also meant that Wilson was forced to take on some engineers whom he didn’t really care for all that much. Included in these were the German scientists, Habermohl and Miethe, the aging Italian, Dr Belluzzo, and the ambitious Luftwaffe engineer, Rudolph Schriever. Most of those men were actually there to watch Wilson, and their presence around his project really annoyed him. He therefore kept them busy by letting them work on various designs, which they could then forward at regular intervals to Himmler. Few of the designs were worth the papers they were drawn on, but they kept Himmler happy, soothed the vanity of his four supposed innovators, and enabled Wilson to get on with the real work without too much interference.

‘Determined that his project should be the most advanced then in existence, Wilson traveled all over Germany, visiting the other research centers, and utilizing any innovation that could enhance the possibilities of his own project.

‘At this point you must understand that while it is true that the German scientists as a whole were then working on some remarkable innovations, it is equally true that their separate projects were rarely coordinated. So great were the rewards in Nazi Germany, and so terrible the penalties, that even formerly cooperative scientists were reduced to seeking favor by competing ferociously with one another. In this sense, the Peenemünde situation was typical: while we had the cream of our rocket engineers working on the V-1 and V-2 rockets at Peenemünde, the V-1 wasa Luftwaffe project, the V-2 was an Army project, and both sides competed with one another instead of putting their heads together. Similarly, while various establishments scattered all over Germany and Austria were working separately on gas turbines and jet propulsion, heat resistant and porous metals, and gyroscopic mechanisms and boundary layer-defeating airfoils, it was not until the arrival of the relentless Wilson that someone had the sense to link these innovations together in one astonishing, revolutionary aircraft. Wilson did that – he combined the cream of German innovations – and in five years he had completed the prototype of his first flying saucer.

‘Now, Himmler was excited by the possibilities of the flying saucer, but he never mentioned the saucer to Adolf Hitler. Indeed, the only thing *der Führer* knew about Kummersdorft West was that it was only one of many aeronautical research centers and that it was probably engaged in producing conventional aircraft. Regarding technological matters, Hitler knew very little, since he expected Himmler to keep him informed. That was a mistake. Himmler kept a lot to himself. So Hitler knew about Peenemünde, about the V-1 and V-2 rockets, but otherwise he only heard about “secret” weapons that were still being processed.

‘Himmler had good reason for his secrecy. Back in 1938, Hitler, anxious for a foothold in the Antarctic, had sent an expedition commanded by Captain Alfred Richter to the coast due south of South Africa. Daily for three weeks two seaplanes were catapulted from the deck of the German aircraft carrier, *Schwabenland*, with orders to fly back and forth across the territory that Norwegian explorers had named Queen Maud Land. The Germans made a far more thorough study of the area than the Norwegians had done – believed to be the most extensive aerial study undertaken up to that time – finding vast regions that were surprisingly free of ice. Their airplanes

covered two hundred and thirty thousand square miles in all, photographing almost half of the area. They also dropped several thousand metal poles, each marked with the swastika and pointed at the tip so that the poles would dig into the ice and remain upright. This job done, they renamed the whole area *Neuschwabenland* and then claimed it as part of the Third Reich.

'From that moment on, men and equipment were shipped regularly to Neuschwabenland for the purpose of building a secret underground military base. Most of the men were either specially trained SS troopers or slave workers from the concentration camps. Now, while Hitler was aware of the fact that Himmler was shipping his men to the Antarctic, he thought of it as a purely military endeavour. As far as *der Führer* was concerned, the secret base in Antarctica, being constructed underground, was merely an SS training base designed to acclimatize scientists and soldiers to those rigorous conditions in preparation for explorations after the war. However, the truth is that Himmler was pursuing a dream that did not include Hitler, would supersede the Third Reich, and would place Himmler up there with the immortals as the Lord of Atlantis.

'Let me clarify this. Himmler's obsessions were numerous, bizarre and totally mad: sorcery, mesmerizm, clairvoyance, reincarnation, faith healing, Lemuria, Atlantis, the mystic strength of the *Volk*. Himmler also believed absolutely in Horbiger's fanciful doctrine of Eternal Ice – that a world of ice was the natural habitat of Nordic men – and he therefore also believed that a return to such a world would lead to men who were like gods. It was because of this dream that Himmler, when he was given the task of organizing the SS, did not envisage it as a normal police force but as a real religious order devoted to the creation of the perfect man. Indeed, right from the start it was his intention to eventually isolate the "élite" of the SS from the world of ordinary men for the rest of their lives. It was also his intention to create special colonies of the "élite" all over the world, answerable only to the administration and authority of Himmler's New Order.

'For this, the first step was the creation of special schools in the mountains of Bavaria where the SS élite were indoctrinated in Himmler's ideals and firmly convinced that they were the unique new men "far finer and more

valuable than the world has yet seen." The second step was the creation of the *Ahnenerbe* – the Institute for Research into Heredity – whose function was to finance and publish Germanic researches and to supervise the so-called "anthropological" medical experiments in hellholes like Auschwitz and Dachau. The third step was to eliminate the Jews from the face of the Earth, and to transport all subhumans – the Poles, Czechs and Slavs – to the numerous concentration camps and keep them there, generation after generation, as slaves to the Reich. And the fourth and most important step was the *Lebensborn* – Spring of Life – which would, through the controlled mating of élite SS men and pure Aryan women, breed out the "imperfect" German types within one hundred years.

'A world of ice and fire: the Antarctic and the SS. This dream obsessed Himmler night and day and then became a reality. He had his colony: the Antarctic. He had his masters: the SS. He would send his slaves to the Antarctic, use them for labor and as medical or surgical guinea pigs, and in time, with scientific application, the Superman would be born.

'You do not believe, Herr Stanford? You do not think it possible? Then think of the *Ahnenerbe* and the *Lebensborn*, of the medical experiments and controlled breeding, of Belsen and Buchenwald and the SS torture chambers, of the millions who were processed like battery hens and emerged as warm ash. The concentration camps were no accidents. They indulged in imitative rites. They were the prototypes for the social order of the future: that world of masters and slaves… And think again, Herr Stanford, of the *Lebensborn*. Apart from arranging matings between the SS élite and fine blonde ladies and adopting "racially suitable" children for childless parents, the *Lebensborn* also abducted thousands of "suitable" children from the occupied territories and had them raised in special SS institutions… And a lot of those children – indeed, thousands of those children – simply disappeared from the face of the Earth.

'So, it was Himmler. Hitler never knew about it. Himmler wanted his secret colony, he wanted his world of ice and fire, and he wanted the extraordinary flying saucer for his future protection. Thus it was that by 1943 more concentration camp prisoners and children abducted by the *Lebensborn* were being shipped to the Antarctic, and that a lot of valuable equipment,

including components for the flying saucer, were disappearing via the South Atlantic route in SS controlled submarines.

‘Alas, Himmler’s dream then collapsed. By that time it was clear to most of us that the war would eventually be lost. This awareness put Hitler in a panic, made him yearn more desperately for some extraordinary new weapons, and finally encouraged him to look fondly at the V-1 and V-2 rocket projects. Then, after the August 17 bombing of the Peenemünde research centers, Hammler persuaded Hitler to hand the whole project over to the safekeeping of the SS. A month later, on September 3, 1943, SS General Hans Kammler was put in charge of the transfer of most of the Peenemünde development works – not including Wernher von Braun – to caves in the mountains near the Traunsee in Austria, and mass production of the rockets to the underground factory in Nordhausen in the Harz Mountains. This effectively gave Himmler a new pet project and distracted him from Wilson.

‘By early 1944, Wilson, now working at the BMW *Platz* near Prague, had replaced his original flying saucer’s turboprop propulsion system with a new, highly advanced jet propulsion system, thus completing the first truly operative machine. It was Wilson’s intention to test-fly the machine as soon as possible, but increasingly darker thoughts about Himmler put him off this idea.

‘Bear this in mind about Wilson: As a child in America he had, like our own Wernher von Braun, been obsessed with the potential of space flight. A genius himself, he had secretly worked with the genius Goddard, and had observed how that gentleman was mistreated by his own country. Because of this – and because of his bad experience in Iowa – Wilson was obsessed with the need to avoid a similar fate and find absolute freedom regarding his work. That freedom was to be found in the Antarctic. It was to be found in a master and slave society. And Wilson wanted that society to succeed more than anything else.

‘By 1943, however, it was Wilson’s belief that Himmler was basically insane, that he would eventually fall apart, and that he would then represent a threat to Wilson’s plans for escaping. Knowing that this view was shared by a few other high-ranking officers, Wilson waited until the time was ripe

– when the forthcoming defeat was evident – and then approached them with a separate escape plan. One of those officers was myself, another was SS General Hans Kammler, and a third was SS General Artur Nebe, a very secretive man. It being that both Kammler and I had been directly responsible for the utilization of slave labor, and that Nebe had been in the Gestapo and had also headed an extermination squad in Russia, we were all well aware of what our fate would be should the Allies get hold of us. Needless to say, we fell in with Wilson's plan.

'The crux of the plan was to make Himmler forget our project and turn his attention elsewhere. Consequently, Wilson started to lie about his project and submit incomplete drawings to Himmler and one of his favored engineers, namely *Flugkapitän* Schriever. While never going far enough to make Himmler suspicious, Wilson nevertheless understated the actual progress being made and told Himmler of bad setbacks, involving labor and equipment, that never for one minute existed. This worried Himmler – like Hitler, he desperately wanted an extraordinary new weapon – and as anticipated, he turned away from Wilson and looked elsewhere.

'This brings me back to Wilson's unwanted associates, particularly *Flugkapitän* Rudolph Schriever. Now remember that it was mostly the unworkable drawings of Schriever that had been passed on to Himmler – *not* the more advanced Wilson drawings. Therefore, in accordance with Wilson's plan, Hans Kammler, shortly after the Allied invasion of Europe, intimated to Himmler that the Schriever drawings were more advanced, that Wilson was maliciously holding Schriever back, and that Schriever should be given his own research facility and allowed to continue with his work without further interference. Kammler also suggested that because of the terrible bombing raids over Berlin and its surrounding areas – and because of the successful Allied invasion – the research center at Kummersdorft West should be evacuated to a more inaccessible, secret area. He suggested that Wilson's project be moved to Kahla in the mountains of Thuringia, and that Schriever's new project be located in a desolate area of Mahren. Himmler agreed to this.

'On June 22, 1944, shortly after having fitted his saucer with jet propulsion, Wilson moved from Kummersdorft West to Thuringia. A week later, with

Schriever in charge, the remaining staff of Kummersdorft West were moved to a secret location in Mahren. Thus, while Schriever's progress could be watched closely by Himmler, Wilson could complete the genuine flying saucer under the protection of Hans Kammler and myself.

'What we now needed was a tightly controlled escape route that would take us from Kahla to Kiel in the Baltic. The best man for such a task was clearly Artur Nebe, an SS general with a keen sense of survival and sound training in all kinds of intrigue. Unfortunately, while Nebe had once been one of the most favored of the SS, he was now under suspicion from those closest to Hitler and knew that he was being watched all the time. Nebe had to disappear – he would have to work in anonymity – and his chance came on July 20, 1944, after the attempted assassination of Hitler.

'That assassination attempt led to the most terrible reprisals, and many of our officers, in fear for their lives, fled and then disappeared for good. One such officer was General Nebe. He had a lot of fanatical followers. Nebe fled straight to Kahla, took a lot of his men with him, and those men organized the escape route from Kahla to Kiel. Thus it was that by early 1945 important men and materials were being quietly moved from the research complex in Thuringia to sympathetic submarines and ships in Kiel harbor on the Baltic Sea – the moves officially authorized by favored SS General Hans Kammler and tightly controlled by the anonymous General Nebe and his other "missing" SS men.

'Kammler was in the perfect position to arrange all this. Now trusted implicitly by Himmler – and therefore revered by his SS troops – Kammler could move men and equipment anywhere without being questioned. More so because by this time he had been placed in full charge of the V-2 program and that program had become Hitler's final hope. Naturally, since the job gave Kammler the freedom to travel at will around the German-occupied territories, he worked like a demon on the launching of the V-2s and made sure that all his movements were noticed. In this way, Wilson could assemble the complete prototype of his flying saucer in the underground factory at Kahla – undisturbed by the increasingly disillusioned Himmler, ignored by the V-2 obsessed Hitler, and otherwise protected by General Nebe and his runaway subordinates.

‘Kammler had another useful job at this time. While the infamous Alpine redoubt had never really existed, Hitler was still dreaming of forming a last redoubt in the mountains of Germany. Since his chosen area was to include the metaphorical arc that ran from the Harz Mountains to Thuringia, south of Prague and across to Mahren, Kammler was put in charge of all the important research centers hidden deep in those areas. Again, this made it easy for him to protect Wilson’s project in Kahla and insure the continuing shipment of men and supplies to the ships and submarines in Kiel Harbor.

‘By early February 1945, Wilson had completed a truly advanced flying saucer and a test flight was arranged for the fourteenth of that month. Unfortunately, when the saucer was wheeled out of its hangar during the early hours of that morning, bad weather, including rain and snow, caused the test to be canceled. Two days later, however, a resoundingly successful test flight was made.

‘The saucer tested near Kahla on the morning of February 16, 1945, was known as the *Kugelblitz*. Basically, it was a triple-layered, disk-shaped machine with a diameter of fourteen thousand and four hundred millimeters and a height from base to canopy of three thousand and two hundred millimeters. The central body was made from heatresistant, nickel-based alloys and titanium; and the top and bottom disks of this circular body rotated at varying speeds around the two-pilot control cabin, which was molded to the solid body that housed the engine. While the spinning disks were devoid of all surface protuberances such as wings and stabilizers, their porous metal composition would suck the air through the machine and utilize it as an added propulsive force.

‘As with the previous turboprop version, this saucer’s four legs also functioned as downward thrusting, swiveling tail pipes used for lift-off, but now activated by low and high pressure compressors generating an enormous thrust and including a new vaporizing fuel injector system that rendered the jet thrusters smoke-free. The jet burners lifted the *Kugelblitz* vertically, at modest speed, to a height of just over one hundred feet; once there, the downward thrusting tail pipes would swivel up through the bottom disk and be locked into position in the molded central body. Four similar boosters, situated at equal distances around the immovable central

body, would then be used for horizontal propulsion and direction control, while the upper and lower disks, with their porous composition, would revolve at high speed to utilize the boundary layer and achieve unprecedented high speeds.

'The *Kugelblitz* was in fact a giant-sized *Feuerball* – the most recent spin-off from Wilson's endeavours – and as such was remarkably sophisticated. During the test flight it reached an altitude in excess of forty thousand feet at a speed of approximately twelve hundred and fifty miles per hour. Not yet capable of the extraordinary maneuvers of the modern UFO, it nevertheless incorporated a special inertial shield for the protection of the pilots; an automatic control system that utilized the profile of the terrain below; high frequency, omnidirectional, automatic navigation; and a few primitive, but fairly effective, pulse beam weapons.

'Naturally, with the flying saucer project completed, our most urgent task was to transfer the project to the Antarctic, obliterate all signs of our work in Kahla, and ensure that nothing was left for the advancing Allies. Bear in mind that we had, as each separate section of the machine had been successfully tested, been shipping those parts to the Antarctic, component by component, throughout the last few years. Now, the only components that still had to be shipped out were those belonging to the redesigned jet engines. Within a week of the test flight those components were removed from the *Kugelblitz*, the machine itself was blown up, and then Wilson, accompanied by Nebe and other SS personnel, made his way by truck and train to the port of Kiel. Two days after that, on February 25, 1945, the remaining slave workers of the underground Kahla complex were driven back to Buchenwald where they were gassed and then incinerated in the crematoria. The Kahla complex was then a deserted shell.

'Himmler never knew about the evacuation of Kahla since he was too obsessed with the rapid Soviet advance. To distract him further, General Kammler suggested that the scientists still at Peenemünde be made to join the others in Nordhausen, pointing out that a new research center was being built in the Bleicherode mine and that accommodations had been prepared for the technicians and their families in the surrounding villages. Himmler gladly agreed to this move, and not long after, Wernher von Braun and his

associates were moved by train, truck, private car and barge to their new quarters deep in the Harz Mountains.

‘By this time, exactly as Wilson had anticipated, Himmler was falling to pieces. No longer trusted by Hitler, and having just made a fool of himself by allowing the Russian army to reach the outskirts of Berlin, he was spending most of his time in Dr Gebhardt’s sanatorium at Hohenlychen, seventy-five miles north of Berlin, and idiotically planning his private surrender to the Allies.

‘At the end of February, while Wilson and General Nebe were hiding just outside Kiel and Kammler was transferring the Peenemünde technicians to Nordhausen, I paid the *Reichsführer* a visit. Babbling dementedly, he told me that his peace negotiations were not progressing, that he was going to try approaching Eisenhower, and that he intended using Schriever’s flying disk as a bribe to the Allies.

‘Following Kammler’s instructions, I informed the *Reichsführer* that the Wilson project had made no progress, that Wilson had been shot while trying to escape toward the Allied lines, and that the research complex at Kahla had been evacuated and then blown up to prevent it from falling into Allied hands. I also told him that since the enemy would soon be reaching Hohenlychen, there was little chance of escaping to the Antarctic and that his peace negotiations were therefore our only hope. Himmler, terrified by this news, asked me to inform Kammler that the last redoubt was to be held at any cost. Meanwhile, he, Himmler, would arrange for the Schriever disk to be tested as soon as humanly possible.

‘Knowing that the Schriever disk could not possibly fly, I returned to wait for Kammler at Nordhausen. At the end of March, Kammler returned to the Hague where he had, ostentatiously, been firing the last of the V-2 rockets on London. Unfortunately, just before we could join Wilson and Nebe in Kiel, Kammler received orders from Himmler stating that American forces were approaching Nordhausen and that the whole complex therefore had to be evacuated. Determined to ensure that no suspicion fell upon him, Kammler went ahead with this task.

‘However, Kammler did not go with the evacuees. Seeing a more surreptitious way of making his escape, Kammler, on the second of April, took about five hundred V-2 experts to the Bavarian Alps in the region of Oberammergau, traveling with them in his private SS train. Once there, the technicians were imprisoned in army barracks and guarded by some SS fanatics. Included in this group were Wernher von Braun and General Dornberger – and shortly after they were imprisoned, General Kammler quietly disappeared for good…

‘Did I go with him? Obviously not. On that very same day, when Kammler was on the train to Oberammergau, I returned to Berlin to check on the general situation. However, once in Berlin I found myself buried in plots, counterplots and other intrigues. As for Himmler, he just wouldn’t let me go. Now totally hysterical, hiding pathetically in his sanatorium, he was studying his horoscope, still trying to negotiate a separate peace, and babbling constantly about Schriever’s flying disk and how it could save us all.

‘In the end, it was Schriever’s worthless saucer that got me trapped in Berlin. Now believing that the Wilson project had been terminated and that Wilson had been shot, Himmler insisted that I supervise the test flight of Schriever’s supposedly completed prototype. Reluctantly I did this – I arranged the test flight for mid-April – but the test was called off in the face of the Allied advance, the prototype was destroyed by the retreating SS, and Schriever’s few worthwhile drawings were stolen from him and burned in my presence. After that, Himmler collapsed, eventually killing himself, and I fled the holocaust of Berlin and finally ended up here.

‘And the others? On April 25, 1945 – five days after Hitler’s birthday, two days after the first meeting between Soviet and US troops on the banks of the Elbe, three days before the Allies crossed to the Eastern Bank, and five days before Hitler killed himself in his bunker in Berlin – General Kammler joined Wilson and General Nebe aboard submarine U-977 – bound for the Antarctic.’

Chapter Thirty-Two

April 26, 1945. We had left Kiel illegally, not daring to ask for fuel, so we pulled into Christiansund South to fill up the tanks. The war news was bad. The Soviets were in Berlin. The Americans and Russians had finally met at Torgau on the Elbe. The end was in sight. The submarine submerged the next day and kept hugging the coastline. I often went to the hold to check the crate, though I knew this was pointless. General Nebe kept to himself, his dark eyes revealing nothing. General Kammler was obsessed with the radio and passed on the news. None of this news was good. The Reich was obviously about to fall. When the death of Adolf Hitler was announced, we all knew it was over.

Captain Schaeffer called a meeting. Nebe and Kammler sat together. General Kammler was tense and energetic, Nebe was expressionless. The war was over, Schaeffer said. That raised certain problems. There would be no submarine tankers in the South Atlantic, which meant no food nor fuel. We would have to change our plans. We would never make it to the Antarctic. With luck, we might reach Argentina, but we couldn't go farther.

I confess: I was shocked. My one thought was for the wilderness. I glanced at Nebe but his dark gaze was unrevealing, so I then looked at Kammler. The general's eyes were bright. He mentioned Colonel Juan Peron. He reminded us that Peron was a man who could not resist money. Kammler smiled when he said this. He was an organized man. He then added that he had already discussed the matter with the necessary people. General Nebe did not smile. Captain Shaeffer looked relieved. We agreed to head straight for Argentina at no matter the cost.

Not quite straight: a digression. Some of the crew became rebellious. The war was over and they wished to return to Germany, and Schaeffer agreed to this. We hugged the Norwegian coastline. We only surfaced at night. A few days later we reached the mountainous coast of Bergen and let the men off.

I climbed up to the deck. I had to breathe the cooling air. I saw patches of stars between the clouds, the dark water, the jagged cliffs. The men shivered on the deck. General Nebe surveyed them coldly. The men shuffled their feet on the deck and shook hands with their comrades. I looked across the calm sea. The coastline was featureless. The sea lapped against the submarine as

the men clambered overboard. I felt a great yearning. I wanted to rest my feet on dry land. After this, we would spend months in the submarine, mostly submerged.

May 10, 1945. The real voyage began. My strongest memories are of constant heat and stench and the engine's bass rumblings. It was too long for sanity. We were living on top of one another. First a day, then a week, then two weeks, the submarine like a tomb. The North Sea and the English Channel. The blackened breast of Gibraltar. When we surfaced, our freedom was brief and airplanes made us fearful. In truth, we rarely surfaced. The hatch was opened to let air in. We would see a glittering circle of sky and then the hatch would be closed again. Then along the coast of Africa. A stolen glimpse of sun and sand. Then thirtysix days underwater, a nightmare of sweat and noise.

By June the crew was restless. There were arguments and fist fights. Once a man took his knife from his dinner plate and slashed the face of a friend. Captain Schaeffer gave them beer. He was a careful, thoughtful man. There was peace for at least another week, but then more fights broke out. General Nebe's dark eyes were watchful. His hand often stroked his pistol. He started pacing up and down the submarine, murmuring words here and there. His words calmed some restless souls. Nebe's dark eyes tamed their rage. They would stare at his eyes, at his pistol, and remember his history. After that, it was easier. It was miserable, but less dangerous. We turned away from one another, faced the walls, and let our own thoughts sustain us.

We surfaced six weeks later. We were in the middle of the South Atlantic. A fierce sun burned a hole in the sky, and the green sea was placid. This reprieve was a blessing. The next month was more bearable. We alternated between floating on the surface and diving back to the depths. Then the Cape Verde Islands. We went ashore on Branca Island. The men frolicked on the burning white sand and washed themselves in the dazzling sea. That day was all too brief. The droning of aircraft made us leave. The submarine dived back to the depths and our journey continued.

Nevertheless, life was easier. We started surfacing almost daily. Once we stayed on the surface for a week by disguising the submarine. False sails

and false funnel. From the air we looked like a cargo steamer. The airplanes droned overhead but ignored us, not suspecting a thing. The men waved at the planes. They fought their boredom with such humor. They would watch the planes flying away, and then lie down and sun themselves.

Nebe usually remained below. He liked the claustrophobic depths. Kammler paced the deck and searched the horizon like a man with no time to spare. Eventually we saw land. It was the coast of Rio de Janeiro. Kammler smiled and climbed down through the hatch to listen in on the radio. The news was not good. Kammler relayed what had happened. Another fleeing submarine, Captain Wehrmut's U-530, had recently put into the River Plate with unfortunate results. The whole crew had been taken prisoner and handed over to the Americans. Kammler told us this, studied us, enjoyed our despair, then grinned and mentioned a place called Mar del Plata and went back to the radio.

August 17, 1945. We docked at Mar del Plata. Four months after we had boarded at Kiel we stepped off in the Argentine. We had no need to worry. An arrangement had been made. From here we were to be transported to a secret airfield in Bahia Blanca, and from there flown directly to the Antarctic.

The thought filled me with pleasure. I looked along the crowded deck. The Argentinian officials crossed the gangplank, their medals flashing and jangling. They did not look too happy. They were mopping their sweaty brows. I sensed immediately that something was wrong and crossed over to Kammler. He shook hands with the officials. The man with most medals whispered. Kammler's lips formed a single, thin line that expressed his concern. He then smiled at Captain Schaeffer. He introduced us to the officials. We all had wine and biscuits on the desk, the sun blazing upon us. A short delay, someone said. An unfortunate mishap regarding transportation. We would have to spend some days on the submarine before we could leave. Captain Schaeffer agreed to this. He was a reasonable, thoughtful man. The Argentinians all smiled and bowed politely and then left in a hurry.

I spoke to Kammler and Nebe. We met at midnight on the deck. It was dark and I saw the moon reflected in Nebe's depthless eyes. Kammler spoke in an

urgent whisper. He told us what had really happened. He said that British and American Intelligence had picked up the information that Hitler was not dead and that he and Martin Bormann had escaped from Germany. Reportedly they had fled in a submarine. They were thought to be heading for Argentina. It was the British and American wish that the Argentinians report the arrival of any German submarines in their waters. Thus the Argentinians were in a panic. They felt that something must be done. What they wanted was to offer the Allies a little something to chew on.

General Nebe lived by intrigue. It was bread and meat to him. His dark eyes offered no pain or pleasure as he outlined a compromise. We three alone would leave. We would take the precious crate with us. But to save the Argentinians embarrassment, we would leave the rest of our men behind us. They would be held as political prisoners. The Argentinians would hand them over. That way, the Argentinians would look good and we would save our own necks.

Ruthless? Yes. But then the three of us were ruthless. We had lived in the Third Reich a long time and learnt how to survive.
We agreed to Nebe's plan. It could not possibly fail. The fate of Schaeffer and his crew did not concern us and could hardly affect us. It didn't matter what they told the Allies. By then it would be too late. By then we would be hidden in the Antarctic, our whereabouts unknown. The Allied forces would then be helpless. They would never locate our underground base. They would know that the underground base existed, but they wouldn't dare admit to it. How could they mention it? It would only lead to panic. And so, aware of this, knowing the Allies would be helpless, we decided to drop Schaeffer and his crew and go on by ourselves.
We unloaded the crate the next day. This aroused no curiosity. Schaeffer assumed that we were simply unloading it for safekeeping on shore. That same night we slipped away. Some army officers were waiting for us. I saw my crate in the rear of their truck and I climbed up beside it. Nebe and Kammler quickly followed. We glanced back at the submarine. We saw the other troops moving along the dock, their rifles aimed at the submarine. Then we were driven away in the truck, leaving the submarine behind us. The flat plains of Argentina lay about us and the stars glittered brilliantly. Kammler looked at me and smiled. Nebe pursed his lips and slept. The night

passed and a pearly dawn broke and then we reached Bahia Blanca.
The airfield was heavily guarded. The plane's engine was already running. The truck pulled up at the hold of the plane and the crate was unloaded. General Kammler climbed in first. I let Nebe go ahead of me. I glanced briefly around the airfield, at the troopers and barbed wire fences, at the flat plains that stretched out to the sky, and then I boarded the plane. The doors of the hold were closed. The steel locks made a clanging sound. I sat down beside Kammler and Nebe and stared up at my large crate. Then the plane roared and shook. It taxied slowly along the runway. Then it roared even louder, raced along the runway, jolted, leapt off the tarmac, and climbed into the sky.
Perhaps I slept then. I do not remember the flight. I remember Nebe's dark, depthless eyes and the plane's constant rumblings. It did not take very long. My spinning thoughts destroyed time. Kammler smiled when the wheels touched down again and the crate bounced a little. I reached out and steadied it. The plane shuddered and stopped. The doors opened and a bright light rushed in and brought with it the shocking cold.
All white. Everything. The frozen wilderness stretched out before us. I stepped down and my boots sank into snow and I breathed the pure, icy air. We were on a modest airstrip. Our own plane was waiting for us. We transferred the crate to this plane and then clambered in after it. The doors closed behind us. The plane's skis chopped through the ice. We took off and flew above the white wilderness and headed inland. All white. Everything. The plains and mountains were as one. My impatience was a hand upon my heart, my exultation was boundless. Then at last we dropped lower. I saw the enormous, encircling plateaux. We flew down below the mountains, below the glittering ice peaks, and then the great caves opened out to embrace us and carry us home.
Here we are and here we stay. The ice glitters in the sun. History changes and the world surrenders to us. We are here. We exist.

Chapter Thirty-Three

Stanford arrived early, deliberately so. Slowing down at the crossroads, just before the proposed meeting place, he turned off the road and drove between the trees, comforted by the darkness and moonlight, feeling safer that way. He stopped the car, turned the lights out, killed the engine, took a

deep breath, then looked out at the darkness, glancing up at the sky, half expecting, as he always did these days, to see glowing lights merging. When had Epstein disappeared? November 1977. Since then, a whole year had passed and a new year was dawning. Stanford shivered at the thought of it. He didn't think he would survive it. Reaching into the glove compartment, he pulled out a pistol, checked it, then got out of the car and closed the door, taking great care to be quiet about it.

The sky over Virginia was starry. There was no wind at all. Stanford could smell the wet grass and felt the chill in the air, marvelling at how soothing it was after the furnace of Paraguay. He checked the pistol again, checked the time, shivered briefly, then he walked back through the trees to the road, his eyes scanning from left to right.

The road was still deserted. Stanford studied the sky again. He grinned automatically, more self-mocking than amused, thinking of himself as a fugitive and wondering how it had come to this. The road remained deserted. Stanford checked his wristwatch. Satisfied, he went down on one knee on the grass behind a thatch of densely tangled brambles. The surrounding hills were covered with trees. He remembered Epstein in Mount Rainier. His lips tightened as he stared along the road and heard a sound in the distance.

Fuller was on time. He had always been reliable. Stanford got up off his knee, but stayed low as he cocked the pistol, seeing the lights of Fuller's car emerging from the darkness. The road was flat and straight. The car approached the crossroads. Stanford held his breath as the car slowed down and then stopped, its engine still ticking over. Fuller flashed his headlights twice. Stanford let his breath out, then looked along the road, past Fuller's parked car. He saw nothing else coming. Fuller flashed his lights again. He was expecting a response. Turning away, Stanford loped back through the trees, cutting around in a circle. He emerged behind Fuller's car and checked that there was no one else in it. There wasn't. That relieved him somewhat. He stepped out from the trees, the pistol heavy in his hand. Walking up to the car, he bent down and hammered lightly on Fuller's window with his knuckles. Fuller rolled the window down and looked up and saw the barrel of the gun in his face.

‘Stanford?’
‘That’s me.’
‘What the fuck are you doing? You asked me to meet you and I’m

here. What’s the fucking gun for?’
‘Are you alone?’ Stanford asked.
‘What the hell do you think? Take a good look. You’ve got eyes in

your head. I’m all alone, for chrissake!’
‘Get out of the car,’ Stanford said.
‘I don’t believe this,’ Fuller said. ‘I came here because you asked

me – and now you’re sticking a gun in my face. Have you gone fucking crazy?’
‘I’m sorry,’ Stanford said.
‘We’re old buddies, for chrissake!’
‘I’m sorry. I’m a little bit nervous. Now get out of the car.’
Fuller sighed and rolled his eyes, killed the engine and headlights, clambered out and raised his hands in the air as if begging for mercy.
‘You must have lost your fucking marbles,’ he said. ‘Who the hell do you think you are? Elliot Ness? Get it out of my face.’
‘This way,’ Stanford said.
‘It’s a joke,’ Fuller said. ‘He drags me out of my bed to stick me up. An old buddy from way back.’
Stanford waved the pistol gently. ‘I’m not joking,’ he said. ‘If I have to use this pistol, I’ll use it. Over there. Through the trees.’
Fuller sighed and shook his head, not believe what was happening, forced a grin and then sauntered across the road to the trees, Stanford’s pistol prodding him on when he appeared to hesitate.
‘In here?’ Fuller asked.
‘That’s right,’ Stanford said.
‘It’s a picnic,’ Fuller said. ‘A midnight treat. I can’t fucking wait.’
Stanford kept the gun on him, still liking him, not trusting him, not capable of trusting anyone anymore, not even his oldest friends.
‘Can I stop now?’ Fuller asked.
‘Yes, you can stop now.’
‘I take it that’s your car,’ Fuller said.

‘That’s right. Get inside.’
Fuller sighed again, ran his fingers through his gray hair, opened the door and lowered himself onto the front passenger seat, his broad body looking cramped in that small space. Stanford went around the front, keeping his pistol aimed at the windscreen. He opened the door and slid into the driver’s seat, the pistol still aimed at Fuller.
‘Where are we going?’ Fuller asked.
‘Nowhere,’ Stanford said. ‘We’ll just sit there and have our little talk and then I’ll let you go home.’
‘You’re real generous,’ Fuller said.
‘I’m sorry,’ Stanford said.
‘My old buddy’s sorry,’ Fuller said. ‘I feel better already.’ He was a big man, all muscle, his face as rough as they come, and he ran his fingers through his hair again, his grey gaze focused straight ahead. ’Okay, I’m impressed,’ he said. ‘We’re sitting here in the middle of nowhere and you’re pointing a gun at me. What the fuck’s going on?’
‘It’s the UFOs,’ Stanford said. ‘I want to talk about the UFOs.’
‘I figured that,’ Fuller said. ‘You always do. Only the pistol is new to me.’
‘I’ve had a bad year,’ Stanford said. ‘I have the impression I’m being followed. My apartment’s been turned over twice, my phone’s been cut off, and a hit-and-run driver smashed my car… I just don’t feel too safe.’
‘This is a pretty dangerous country,’ Fuller said. ‘I thought you understood that.’ He glanced down at the pistol, shook his head in mock despair and grinned laconically. ‘I’m putting my hand in my pocket,’ he said. ‘It’s not for my own weapon, believe me. I just need some chewing gum.’
Stanford nodded his permission. Fuller pulled out some gum. He unwrapped it and popped it into his mouth and proceeded to chew.
‘So,’ he said, ‘you’re nervous. You’re being harassed. And you think we’re the bogeymen.’
‘That’s right,’ Stanford said. ‘Those are CIA trademarks. You bastards have been following us since we went to the Caribbean, since we told you about Gerhardt’s abduction. You accused us of lying.’
‘Us?’
‘Me and Epstein.’
‘Epstein’s gone.’
‘Correct. Epstein’s gone. And you haven’t done a damned thing about it.’
Fuller talked while chewing on his gum. ‘What the hell could we do? You

say your friend's been abducted by a UFO and expect us to wear it. It was too much to ask.'
'Why?'
'Don't talk shit,' Fuller said. 'You come up with a story like that and you can't *expect* much.'
'You believed me,' Stanford said.
'That's crap,' Fuller said.
'You've known me too long *not* to believe me… You know I don't invent things.'
'Your story was ridiculous.'
'Then where's Epstein gone? He's been missing for over a year and you guys haven't asked a single question.'
'It's a police case, Stanford.
'Police case, my ass. I told the cops and they laughed me out of the station and forgot the whole thing.'
'What the hell did you expect? You said a UFO abducted your friend. You came on like a crank in a gaberdine, so of course the cops giggled.'
'Fine,' Stanford said. 'But Professor Epstein's still missing. He's a pretty important name and now he's gone and no one seems to be bothered. I think that's pretty strange. I mean, it doesn't make sense. A well known scientist disappears for a year and you guys don't bat an eyelid. That strikes me as strange.'
'So, he's missing,' Fuller said. 'A lot of people go missing. He was an old man, he was on his last legs, and now he's probably dead somewhere.'
'I was there,' Stanford said.
'Yeah, I know. You saw a UFO take him.'
'You believe me,' Stanford said. 'I know that much. That's why you're not looking for him.'
Fuller stopped chewing his gum, stared at Stanford not grinning, then he started chewing the gum again, his jaws working methodically.
'So,' he said, 'we're at an *impasse*. What the hell are we talking for?'
Stanford watched Fuller carefully. His old friend was like a stranger. The pistol was steady in Stanford's hands and he was ready to use it.
'You believe me,' Stanford said. 'You believed me then and you believe me now. You've been tailing me and you know what I found out and it's making you nervous.'
'Oh?' Fuller said. 'And what was that? Just what did you find out?'

Stanford felt hot. He wanted to roll the window down. He was frightened to roll the window down because of who might be out there. His eyes flicked left and right. Realising what he was doing, he felt foolish. Licking his dry lips, he put the pistol in his left hand, wiped his sweaty right hand on his trousers, then transferred the pistol again, all the time keeping it pointed at Fuller. His former friend, his old CIA pal, could no longer be trusted.
'The saucers exist,' he said. 'You've known about them for years. You have your own, but you're keeping them quiet for political reasons. There are other saucers as well. They're extraordinarily far advanced. They represent a threat to this country and so you're running a race with them. You're frightened of those saucers. You're frightened of public opinion. You don't want word about them to leak out and lead to mass hysteria. Those saucers are very powerful. The people who made them are very powerful. They have weapons we can scarcely imagine and they're willing to use them.'
Fuller raised his eyebrows. 'I don't believe this,' he said. 'I think maybe I'm not hearing too good. My old buddy's gone crazy.'
'You have your own,' Stanford said. 'There's no point in denying it. The original prototypes came from Germany, you've been building your own for years, the work was carried out in White Sands and the wilds of Canada, but now the folk who built the original saucers are displaying anxiety.'
'I don't believe this,' Fuller repeated.
'You believe it,' Stanford said. 'You just want to keep it quiet. You killed off Project Blue Book, you harassed all our best researchers, and you've deliberately spread confusion through rumor for the past thirty years. You knew you couldn't keep it secret – you could just confuse the issues – so when anything leaked out you just twisted it and wrapped it in myths. Take Cannon AFB. Take Deerwood Nike Base. Take Holloman and Blain Air Force bases and then tell me they're rumors. They weren't rumors, Fuller. The saucers seen there were your own. People talked and you let the talk lead to tales of extraterrestrials. But the ETs don't exist. Something far worse exists. It's a bunch of wizards down in the Antarctic, and you know all about them.'
'The Antarctic?' Fuller said.
'You're not so innocent,' Stanford said. 'There's a bunch of brains in the Antarctic, they created the original saucers, and now they're so advanced you can't touch them and the government's shit-scared.'
'This is crazy,' Fuller said.

‘No, it’s not,’ Stanford said. ‘The Antarctic’s a very big place and those people are hidden there.’
‘Where?’ Fuller asked.
‘I don’t know,’ Stanford said.
‘No,’ Fuller said, ‘you don’t know. You’re just spouting hot air.’ He shook his head from side to side, chewed his gum, looking disgusted, then stared sympathetically at Stanford and shook his head again, wearily. ‘What horseshit,’ he said. ‘I mean, I thought you had more sense. That’s one of the oldest stories in UFO mythology – and one of the worst.’
‘What story?’
‘Fucking holes in the Poles. UFO bases in Antarctica. Underground cities beneath the ice… Atlantis. Lemuria.’
‘I’ve heard the stories,’ Stanford said. ‘I never believed them for a second… But then I never believed in the saucers either. It turns out I was wrong.’
‘So they come from the Antarctic?’
‘So you admit that they exist?’
‘We don’t have flying saucers,’ Fuller said. ‘And neither does anyone else.’ He tried to grin at Stanford. It was not a successful grin. ‘Let’s assume they’re in the Antarctic,’ he said. ‘At least I might be able to correct you that way.’
‘They’re in the Antarctic,’ Stanford said. ‘They’re in underground plants. They’re the same as the hidden factories of Nazi Germany, and they’re under the ice.’
‘That’s ridiculous,’ Fuller said. ‘You can’t get beneath that ice. Don’t give me that Hollow Earth garbage. That’s a theory for idiots.’
‘Is it?’
‘You know damned well it is. There aren’t any holes at the Poles. Don’t talk like a crackpot.’
‘I don’t know,’ Stanford said. ‘What about the ESSA 7 satellites? The photos taken by those satellites caused a sensation.’
‘It’s beneath discussion,’ Fuller said.
‘Tell me anyway,’ Stanford said.
‘You’re a scientist. You know the facts well. I don’t have to tell you.’
‘Tell me anyway,’ Stanford repeated.
Fuller shook his head wearily. ‘Okay,’ he said. ‘You want to play games, we’ll play games. I’ll tell you about the photos that conned all the fucking UFO freaks.’ He took out some more gum, unwrapped it, studied it, then

popped it into his mouth and started chewing, looking disgusted. ‘Those famous NASA photos were released to scientific journals, most of whom could have been expected to understand them. Unfortunately, and as usual, the ESSA 7 satellite photos found their way into the hands of certain commercial writers. The enormous holes in the Poles, so clearly shown on the photos, were described, through what can only be termed ignorance, as being just what they looked like: goddamned holes in the Poles.’ Fuller shook his head sadly, chewed his gum, glanced around him, saw nothing but the darkness beneath the trees, so turned back to Stanford. ‘Of *course* they weren’t holes,’ he said. ‘You know that as well as I do. Those photos were obtained by onboard Vidicon camera systems, and as such were not normal pictures. They were, in fact, photomosaics. They were reproduced from the processing of the signals from a lot of television camera frames obtained over a twenty-four hour period. Those signals were processed in a computer and transformed into a polar stereographic map projection with latitude, longitude and the outlines of land areas superimposed electronically. The areas in which camera frames were missing – due to the fact that the pictures were taken during the dark polar winter and the ESSA 7 camera systems lacked infrared facilities – were shown in solid black or white, which accounts for the famous “black holes”. However, current polar-orbiting satellites use a two-channel radiometer instead of the Vidicon camera system, and this radiometer is sensitive to energy in both the visible and infrared spectrums. If you, being the ignorant scientist you’re so obviously pretending to be, care to return to my office I’ll show you the same polar stereographic satellite images from the NOAA 5 satellite in which the visible channel data over the Poles during the polar winter shows holes at the Poles – whereas the *infrared* channel data for the same period shows the land as it actually exists. There are no holes in the Poles and you know it, so let’s fucking drop it.’

Stanford knew he was right. He just wanted him to talk. He wanted to loosen Fuller’s tongue before he pulled his ears off.

‘Okay,’ he said, ‘let’s change the subject. What do you know about Admiral Byrd?’

‘Oh, Jesus, saints preserve me,’ Fuller said.

‘Just tell me.’

‘I’m going crazy. My ears are playing tricks. We’re in the land of the loonies.’

‘Tell me,’ Stanford insisted.
‘Just ask me,’ Fuller said. ‘My imagination doesn’t stretch as far as yours. I can just about answer you.’
Stanford didn’t smile. He kept the pistol aimed at Fuller. Just occasionally he glanced out of the car, scanned the dark, silent forest.
‘Okay,’ he said. ‘Accepting that there’s no enormous hole at the South Pole, the next major UFOlogist theory is that the land around the Pole dips down considerably, forming a sort of giant doughnut, and that this land mass is therefore greater than we commonly think it is and could actually be a lot warmer than the surrounding Antarctic.’
‘Right,’ Fuller said sarcastically. ‘And being so immense, hidden from us and pretty warm, that land could be fertile and inhabited: the home of your saucer people.’
‘It’s possible,’ Stanford said.
‘It’s *not* possible,’ Fuller said. ‘You’re going to quote Admiral Byrd’s remarks about a continent in the sky.’
‘Right,’ Stanford said. ‘It’s been widely reported that Admiral Byrd penetrated a land extent of two thousand and three hundred miles *beyond* the Pole and saw a land mass reflected in the sky. Okay, since we now know about Antarctic conditions, we can assume that it *was* a reflection.’
‘Or a mirage,’ Fuller said.
‘Or a mirage. That still begs the question of how, given where Byrd turned back, he could have reported two thousand and three hundred miles *beyond* the Pole.’
‘He didn’t,’ Fuller said. ‘The origin of that figure is a mystery; it didn’t come from Byrd. Go to your newspaper morgues and you’ll that the actual stated figure was a journey covering approximately ten thousand square miles, with only *one hundred* of those miles beyond the Pole. As for the “Great Unknown beyond the Pole”, that statement – which the UFOlogists have picked up as solid proof for their “hidden continent” theory – is merely the understandable remark of a man who was, in 1947, looking for the first time at a land mass that hadn’t yet been explored. The “Great Unknown” was simply the Great Uncharted
– but it *has* been crossed and photographed since and is no longer “unknown”.’
Stanford started to speak, but Fuller waved his large hand, now involved in what he was saying and determined to finish it.

‘Let me continue while I’m eager,’ he said. ‘I can’t bear your sweet ignorance… It should be noted, regarding Byrd’s *other* much abused remark about that “enchanted continent in the sky,” that Byrd *also* stated that during the flight both he and his crew had no oxygen equipment, that they were suffering from anoxia, and that they were therefore not quite themselves – a point conveniently ignored by your UFOlogists. As for the “enchanted continent in the sky” being a reflection of a land mass not covered in ice, this isn’t as extraordinary as the UFOlogists pretend it is. There are, in fact, and contrary to the assertions of many UFOlogists, many well known ice-free areas in Antarctica – and any one of those could have been the reflection, or mirage, viewed by Byrd. Another popular so-called “fact” is that there are no volcanoes in the Antarctic and that the dust sometimes found there must therefore come from the “hidden” continent. That’s a neat theory except for one thing: there *are* volcanoes in Antarctica.’
Fuller grinned and chew his gum. Stanford inched closer to him. The pistol was still steady in his hand and he felt pretty high.
‘Okay,’ he said. ‘That gets us right to my point. I just want to clear up a little matter and then we’ll call it a day. There are lakes in the Antarctic. There are also ice-free areas. There are mountains and volcanoes, the ice can be a mile deep, and it’s believed that the ice below the surface is actually joined to the sea. That suggests certain things. It suggests hidden valleys. It suggests canyons and caves and other ice-free hidden areas in which a colony of people could exist in comparative safety. I never believed Earth was hollow. I know we’ve charted the Antarctic. But I also know that we’ve only charted it from the air and that there are vast, unknown areas. You know that the people who created and use the saucers are there. You probably know where they are. I want to know what they’re planning, I want to know just where they are, and I want all the facts right now, with no pissing around.’
Fuller stared hard at Stanford. His large body was quivering. Stanford knew he wasn’t quivering with fear, but with cold, suppressed rage. Stanford kept the gun on him. Fuller glanced down at it. He looked at it for a long, thoughtful time and then he raised his eyes again.
‘I’m getting out of here,’ he said.
‘Don’t try it,’ Stanford said.
‘You wouldn’t know how to fire that fucking thing. *Adios*, pal, I’ll see you.’
He started turning towards his door, but Stanford raised the pistol higher.

He tapped the barrel against Fuller's head, then slipped it into his ear. Fuller froze. The barrel filled his ear. Fuller sat there and stared at the dashboard and took a deep breath.
'You wouldn't do it,' he said, releasing his breath. 'Who the fuck do you think you're kidding? You're a scientist. You don't play with those things. Now get it out of my ear.'
'I used to be in the marines,' Stanford reminded him, 'so I certainly know how to use a weapon.'
'Fuck you,' Fuller said.
'It's cocked,' Stanford said. 'Talk or I'll blow your brains out.'
'No way. You won't do it.'
Fuller jerked his head away. He started opening his door. Stanford turned the pistol around, used the grip as a handle, struck Fuller across the side of the head and on the back of his wrist. Fuller's head snapped forward, hit the dashboard and bounced back, and he grunted, his wounded hand flapping, trying to wipe off the blood. The hand dropped down to his side. His good hand swung at Stanford. The latter slapped the hand away with his pistol, then he struck Fuller's wounded hand again. Fuller gasped and flopped forward. He remained there with his head on the dashboard, dripping blood, breathing harshly.
'Talk,' Stanford said.
'Get fucked,' Fuller gasped. 'If you didn't have a gun for a fist, I'd have your balls in my teeth. I'm not talking, you prick. You've gone too far too quickly. If you want me to talk, you'll have to suck me off and you're still not the type.'
'You never know,' Stanford said.
'You fucking marine,' Fuller said. 'I forgot you were one of the tough guys before you turned soft. Now you're just a soft scientist, Stanford. You couldn't hurt a fly.'
'I'll hurt you,' Stanford said.
Fuller tried to raise his head. Stanford hammered it with the pistol. Fuller's head cracked against the dashboard and bled even more. Stanford saw himself in action. He was standing outside himself. He hardly recognized himself anymore, now driven only by anger. His hidden self had stepped forward. He knew what the hunted felt. He was desperate and it lent him a rage that overrode his better, softer nature. He remembered the girl in Galveston, remembered beating up Scaduto, remembered his journey

through Paraguay, the Ache Indians, the cold, brutal German. Yes, he had changed. He knew it now as he looked at Fuller. His old friend, now bleeding and breathing harshly, could no longer be trusted.
'Talk,' Stanford said.
'Jesus Christ,' Fuller gasped. He pressed the dashboard with his thick, hard-ridged fingers, as if trying to bend it. 'You've sure learned a few tricks,' he said.
Stanford smashed Fuller's hand. Fuller yelped and jerked upright. Stanford forced his head back down with the pistol and saw more blood flowing.
'I've changed,' Stanford said. 'I'm not a scientist anymore. I was never a good scientist anyway, but now you bastards have done me in. I won't sit back and take it. I want to get Epstein back. I don't know why it's so important; I just know that it is. I have to find Epstein. I have to know what happened to him. That old man means a lot to me now, and I don't understand it. He said I refused to make decisions, but I did so when he was abducted by that saucer. I decided to track this business to the very end and let no one stop me. Now I want you to talk. I think you'll just have to talk. If you don't talk, we'll sit here all night and I'll hurt you some more.'
Fuller cursed and jerked upright. Stanford hammered him in the stomach. He grunted and flopped forward again, his good hand on the dashboard. Stanford smashed that hand. Fuller screamed and then whimpered. He was propped up with his forehead on the dashboard, dripping blood to the floor.
'Jesus!' he hissed. 'Oh, my God, fuck, it hurts! Okay, Jesus Christ, I'm fucking dying, you win, Christ, it hurts…' He shook his head from side to side, but kept it down, staring at his own feet. The blood was dripping from his head and lips, splashing onto his shoes. 'Okay,' he said, 'you're right. It was the Second World War. The fucking Krauts built a saucer. We found components and various drawings. The British, the Canadians and us – we all found bits and pieces. It was enough to get us going. We all put our heads together. You already know most of the details, so I'll save my breath there. The main work was done in Canada. Other work was done at White Sands. A lot of the UFOs sighted over those areas were our very own saucers.'
'Fine,' Stanford said. 'I know all that. What about the Antarctic?'
Fuller groaned and shook his head. 'It's all on Epstein's tapes.'
'That was Germany,' Stanford said. 'You're confused. What about the Antarctic?'

‘You went to Parguay,’ Fuller said. ‘You went to see that Nazi. We know what the old fucker told you… He told us the same thing.’
‘When?’ Stanford asked.
‘A long time ago,’ Fuller said. ‘That old vulture, he should be dead by now, but we just can’t get near him.’
‘The Antarctic,’ Stanford said.
‘He told you the background, Stanford. That was the start of it all. Those Nazis went to the Antarctic and that’s where it began.’ He shook his head from side to side and wiped his lips. He could hardly use his hands. He groaned and let his hands fall again, his head still on the dashboard. ‘We knew they were there. Captain Schaeffer told us that much. He said they’d gone to Neuschwabenland to build flying saucers. We were inclined to believe him. We had plenty of evidence to back up what he said. We had drawings and components, and we found a few other people who talked. That’s why we launched Operation Highjump. That was in January ’47. It was a military operation disguised as an exploratory expedition, and its true purpose was to find out where the Germans were.’
‘They docked at Neuschwabenland,’ Stanford said.
‘No,’ Fuller said. ‘You can discount that myth. We had to bluff the entire fucking world and we did it with style. We circled the whole continent. We really covered that mother. We split up into three separate groups and flew all over the place. The Central Group, based at Little America on the Ross Sea, covered the area between Marie Byrd Land and Victoria Land, moving inland, in crisscrossing patterns, as far as the South Pole. Meanwhile, the East and West Groups girdled the whole continent, moving out in opposite directions and actually coming in sight of one another’s aircraft. The East Group reached the Weddell Sea. The West Group went as far as Princess Astrid Land. Some airplanes from both groups then flew over Queen Maud Land, including the area that the Nazis had called Neuschwabenland. They saw ice-caps like mountains. Their compasses went crazy. They got lost and then they saw some flying saucers that appeared out of nowhere. The flying saucers buzzed them. The planes’ ignition systems malfunctioned. Four of the planes went down and the others flew away, making their escape, and the crews then told Admiral Byrd about it. The expedition was cut short. The official explanation was hurricane winds. Byrd returned to America and made some indiscreet statements. We told him to shut up, we killed all talk of the flying saucers, and we decided to treat the Antarctic with

considerable care. About three months later, in June 1947, we tested our own saucers over Mount Rainier in the Cascades – and then the saucers we had seen in the Antarctic paid their visits.'
'How did you find out where they were?' Stanford asked.
'We didn't. They found us. They started to play tag with our jets and airliners, just to show us what they could do. They hammered the point home by harassing our top-secret test centers and driving our interceptor pilots nuts. After three years of this there was no doubt in our minds about who those flying saucers belonged to. Naturally, we kept quiet about it; we were shit-scared of panic. We killed off Project Grudge, tried to ridicule all sighting reports, and generally confused the whole issue to turn it into a myth. For the most part this worked. It also worked for our *own* saucers. The Lubbock sightings, for instance, were sightings of our own saucers – and a lot of other sightings were the same.'
Fuller kept his head down. He was bleeding less now. He talked like a man in a trance, his breathing not so harsh.
'They approached us in 1952,' he said, 'and they did it just like regular politicians, through all the right channels. The approach was made by a man called Wilson. He got in touch with the CIA. We met him and he told us his story and we couldn't believe it. Wilson soon proved it, though. He was talking to one of our top men. He already knew our man's address and he told him that the next night he would send a flying saucer over his home. The CIA chief lived in Alexandria, Virginia, he was having a garden party on the night in question, and during that garden party both he and his guests saw a UFO directly over the house.'
'That was when the Director of Intelligence, General Samford, called Captain Ruppelt to a secret meeting in Washington, DC.'
'Right. But Ruppelt didn't know about that Antarctic colony – and we never told him.'
'So, why the meeting?'
'After the UFO sighting over the CIA chief's home, he had another meeting with Wilson. Wilson told him more about the colony, told him what they were capable of, and then said that he didn't want any interference and would trade with the US. Apparently, even with *his* awesome genius and his hundreds of slave workers, he was in constant need of various mass-produced components and equipment. His idea, then, was to form a clandestine partnership with the US, trading certain innovations of his

technology in return for what he required to advance the same. A seesaw arrangement, right? A trick maneuver. But that's what he wanted.'
'And?'
'He was asked what would happen if we decided to say no, and he pointed to various disasters, on land and sea, that we had not, at least up until he told us, been able to explain. Wilson explained them. He told us that he had caused them. We still didn't believe him, so he told us that his saucers would invade Washington, DC. When they did, we believed him.'
'That, also, was in 1952.'
'Yes.'
'And the meeting between Captain Ruppelt and General Samford?'
'That took place after Wilson had told us about his planned invasion. Samford never told Ruppelt anything about Wilson, but he wanted to know about the extent of the UFO sightings. Not knowing about our conversations with Wilson, Ruppelt confirmed that there'd been a massive build-up of UFOs around DC throughout that whole month. He also made it perfectly clear that he was expecting a UFO invasion over the capital. That invasion came, we decided to sit tight, and one week later the saucers came back and we had to tell President Truman.'
'And then you came to an agreement with Wilson.'
'Right. But first we formed the Robertson Panel. The purpose of that panel was twofold. The first task was to convince the public that a proper scientific body had investigated the UFO phenomenon and found it to be fucking nonsense. Also, regarding this, it was our intention right from the start to use the panel's recommendations as an excuse for suppressing all UFO reports. I think you know how we went about it…'
'Yes,' Stanford said.
'Okay. The second and equally important function of the panel was to examine what Wilson had told us and shown us, and to assess his viability as a threat to the nation. Our assessment was that his technology was so far advanced, it constituted an unprecedented threat to the nation – and probably the world. It was therefore decided to come to an agreement with him.'
'I see,' Stanford said. 'So that would explain why the Robertson Panel was made up of men specializing in atomic research and advanced weaponry, why it was chaired by a CIA-classified employee, and why it included Lloyd Berkner, who'd accompanied Admiral Byrd to the Antarctic in 1937.'

‘Yes. It also explains why, when Ruppelt found out that the UFOs were intelligently controlled, we had to get rid of him.’
‘And anyone else who was like him.’
‘Right.’
‘Then you made your agreement with Wilson.’
‘We did. The agreement, simply put, was that we’d have a step-bystep trade, negotiating as and when required for what we both wanted. What Wilson wanted was access to our mass-production industries – and what we wanted was everything he knew. Naturally he didn’t buy this. Instead, he fed us a spoonful at a time. And with neither side trusting the other, we built up a relationship. That relationship gradually grew more complex. Like all relationships, it had its faults. And the biggest was that Wilson was also trading with our good friends, the Russians.’
‘He played one against the other,’ Stanford said.
‘Yes,’ Fuller said. ‘He’s still at it right now. We all trade, we all lose. We keep trying to catch up with his technology, but he always manages to keep just ahead of us. So now the pattern’s changed. We’re all creeping across the Antarctic. The Antarctic is a vast, untapped treasure-house of oil, coal, gold, copper, uranium and, most important, water. The whole world now needs water. Ninety percent of all the world’s water is in the Antarctic. In short, the Antarctic is where the future of the world will be decided, so we just can’t keep out of it any longer. We all pretend it’s not political, that we’re just there for research, but the logic, or lack of logic, in politics is leading straight to a clash.’
‘It’s political leapfrog,’ Stanford said.
‘That’s right. A kid’s game. But somebody’s going to trip up and get hurt – and then all hell will break loose.’
‘Are they Nazis?’ Stanford asked.
‘No,’ Fuller said. ‘They’re a society of masters and slaves, but they’re no longer Nazis. That Wilson is a genius. His genius extends to organization and so he runs that whole place. He’s into parapsychology, electrodes and prosthetics. He has his people implanted when they’re born, and they grow up like zombies. There’s never more than a thousand of them. The system is based on euthanasia. When someone ceases to be of any use, Wilson has him put down. There’s no possibility of resistance. They’re all disciplined with electrodes. They all exist just to work, and that work is for the glory of science. Human beings are vivisected. What he doesn’t have, he steals. We

know he steals people from us, but we discreetly ignore that fact. We can't afford to rock the boat. We have to stay on the seesaw. That colony represents the balancing power and we just can't catch up with it.'
'So the Americans and Russians actually work with him?'
'In truth, he's what we need. The whole world's out of control. We all need what that bastard has, but he's buried down there. So, we continue trading. He lies to us, we lie to him. We keep building more satellites, pulse beam weapons, more powerful saucers, and we think that in a couple of years we might be ready to tackle him. The Russians think the same. Wilson knows what we're both thinking. When we slip up, he demonstrates his technological superiority and then we promptly correct ourselves and back down. It's like I said: it's a seesaw arrangement, a tricky maneuver, but sooner or later it's bound to explode – and I don't like to think of that.'
'So,' Stanford said. 'This explains the secrecy about UFOs. It also explains why the Russians and Americans cooperate in the Antarctic.'
'You've hit the nail on the head, pal.'
Fuller carefully raised his head, lay it back against his seat, then just sat there, breathing deeply with relief, gazing into the darkness.
'Where are they?' Stanford asked.
'Don't even think about it,' Fuller said. 'You go there and you'll never come back, and that's all there is to it.'
'Where *are* they?'
Fuller sighed wearily. 'They're in Neuschwabenland. You fly along the zero meridian, straight in to Queen Maud Land, and about two hundred miles in from the coast, you'll find a range of low mountains. It's really Norwegian territory. It's really part of Queen Maud Land. You usually only find it marked on German atlases, and they call it Neuschwabenland. The Antarctic colony is in those mountains. They've hollowed out the base of the mountains. There's an area where the ice forms a huge circle that resembles a volcano. The carrying ships are down there. They come up out of there. Beneath the circle of ice is solid rock, now honeycombed with long tunnels. The tunnels lead into the colony. They all live and work there. The whole area is protected with a force field that makes unwanted aircraft malfunction. We found that out to our cost. We stopped trying years ago. That whole area is liked the famous Area of Inaccessibility – and our pilots avoid it.'
'I'm going there,' Stanford said.

‘You’re going nowhere,’ Fuller said. ‘I once like you, but you can’t walk away with this. Understand? You’re a dead man.’
Stanford suddenly heard the noise. Glancing out automatically, he saw bright light flashing on and off the trees, beaming down through the darkness. Then Fuller made his move. Stanford turned back and saw him. Fuller had opened his door and was falling backward, one hand inside his jacket. The pistol bucked in Stanford’s hand. Its bang was deafening in the car. Fuller cried out as his body struck the ground, but then he quickly rolled over. Stanford dropped across both seats, heard the roaring helicopter, saw Fuller rolling away from the car, a pistol clenched in his right fist. Stanford fired and Fuller jerked, dropped his pistol and flopped over. Stanford sat up and turned the ignition key as the roaring grew louder.
He didn’t bother closing the far door. A cloud of dust and stones swept over him. The chopper roared descending over the trees and bathed the car in its fierce light. Stanford cursed and put his foot down, reversed, the wheels squealing, shot forward and made a tight turn as Fuller staggered toward him, swaying weakly from side to side. Stanford couldn’t avoid him. He heard a sickening thud. Fuller bounced across the hood of the car, limbs akimbo, his eyes large, mouth wide open, waving frantically and rolling off again. Stanford put his foot down harder, racing straight at the trees, swinging the car wildly from left to right and staying away from the road. First the darkness, then the light: the helicopter was right above him. It came down above the trees, whipped the dirt up, swirling and hissing. Stanford wrenched at the steering wheel. He hit a tree and bounced off. The car shrieked and then shot forward again, crashing through the undergrowth. The chopper roared and deafened Stanford. It was just above the trees. It was whipping the dirt up to his right and forcing him back to the open road. Stanford cursed and kept going, weaving left and right frantically, tearing branches and bark from tree trunks, the car howling dementedly. He managed to keep away from the road. The forest suddenly opened out. The roaring chopper descended into the clearing and smashed the car with its skids. The impact blinded Stanford, made him release the steering wheel. The car shot off to the left and started skidding and he grabbed at the steering wheel again. He went with the skidding, shrieked around in a full circle, was blinded by the chopper’s glaring lights, almost choked in the dust. The car raced toward the chopper. The chopper jerked up and shuddered. A rotor snapped against the branch of a tree and flew

away as the chopper tipped over. The car raced right beneath it, shot back into the forest, was shaken by a thunderous explosion, bathed in fierce, jagged lightning. Stanford managed to glance back. A ball of fire filled the clearing. The fire swept across the field and up the trees, its flames hissing and spitting.
Stanford turned the steering wheel, heading straight for the road. He bounced back onto the road, took the fork to Washington, DC, glanced across the road and saw the burning trees illuminating the forest. The flames soon dropped behind him. He slowed down and drove more carefully. He saw the dark night on all sides, the moon, the glittering stars, and he knew that he would have to leave the country and never return.

Chapter Thirty-Four

Awakening in that bitterly cold dawn of January 28, 1979, still not believing where he was, Stanford shivered and closed his eyes again and thought of how he had come here… He saw the harbor of Manzanillo on the western coast of Mexico, the one hundred and twenty-five-foot ship, its wooden hull creaking rhythmically, moving out in the gray, early-December afternoon, its engines and generators and air-conditioners filling his ears with a muffled roaring. Then due south to Easter Island, the turgid waves rolling slowly, the frigate birds sailing by on their fluttering black wings, the swarm of Galapagos storm petrels like a cloud of locusts. Blue-gray flying fish, the sea's monotonous rise and fall, the sun rising as orange fire, turning into a dazzling white, the pink sunset, then sharp, abrupt darkness, the stars glittering in velvet sky. The gradual death of December. The dawn an eerie green glowing. The sun forming an arch, stretched across the horizon, first green and then turning to red and setting the clouds on fire. The clouds shifted and changed, tinged with pink and orangeyellow, touched here and there with glinting gold, the sea violet, languorous. America was no more. Other worlds were now beckoning. The South Pacific, Cape Horn, the seas rough and uninviting, flocks of whalebirds with blue and white plumage, then the Tropic of Capricorn. White-breasted, dark-backed shearwaters, gliding through the troughs of waves, the southern latitudes with their long ocean swells, the smaller waves in between. The great wings of albatross, their graceful soaring and gliding, then past the southern coast of South America, rain and fog, the winds

moaning. Buoyant Magellanic penguins. More birds high and low. The barren, forbidding rocks of the Ildefonso Islands, the Beagle Channel, its dark, humpbacked islands, brown and bleak and forlorn. Then the New Year coming in, the sea foam-flecked and grim, giant petrels and skuas overhead, the cold winds unrelenting. Farewell to the Old World. No escape from the future. The primeval forests and glacier-encased peaks of Tierra del Fuego. Then the stormy Drake Passage, the current driven by the westerlies, waves fifty to a hundred feet high, the green water smashing over the bow and sweeping back out again. The New Year, a new person: Stanford losing himself. Over the Antarctic Convergence, past Elephant Island, great blocks of rock and ice, flashing ribbons of snow, a shroud made of smokey, drifting cloud, a sudden upthrusting glacier. Time passing and then stopping. Stanford's gloved hands on the railing. Then the ice-encased mountains, seals and whales and pelagic birds, the air brilliantly clear, the cascading ice blue, the mountain ridges of Gibbs Island, the penguins circling the ship, the crevassed ice cliffs sliding past as if not really there. Stanford's gloved hands in the air. A bird fluttering on the deck. More islands, more snowbanks, penguins crowding on the rocks, Greenwich Island, high waves exploding fiercely, the spray cascading and settling. Then a white line in the distance. The approaching Antarctic Peninsula. Then the glaciers and icebergs, huge umbrellas and arches, flat islands of sea ice, the grottoes and canyons and fjords reflecting sun on the green sea. A world like no other. Silent, Majestic. Sweeping plains of packed snow, soaring peaks of glittering ice, the peaks yellow and pink and sometimes black, a blue sheen over all… Stanford opened his eyes again. He looked around him and shivered. He was now at the bottom of the world and could scarcely believe it.

He sat up on his bunk, yawned and blinked, glanced around him, saw that the other bunks were already empty, the Norwegians out at their work. He sat there for some time, staring through the window opposite, seeing nothing but the wall of the dome that surrounded the base. Stanford still felt stunned. He had finally arrived. He swung his legs off the bunk and stood up and hurriedly dressed himself.

The Nissen hut was long and bleak, a converted army barracks, the blankets rumpled on the bunks, clothes and boots scattered all over the place, the

walls covered in pinups. Stanford zipped up his jacket, shivered again as he picked up his gloves, then he walked along the hut, between the bunks, and entered the washroom. He splashed water on his face, combed his hair, put his hat on, made sure that his ears were well covered and then looked in the mirror. A stranger stared back at him, a long-haired, bearded man, his eyes uncommonly hard and intense and possibly mad. Stanford wondered about that. The possibility didn't bother him. Then he turned away and left the hut and looked around the Norwegian base.

The whole camp was inside an enormous, glittering geodesic dome that shielded it from the wind and snow. Beneath the dome were mess halls, administration huts and accommodations, power plants and machine shops and garages. All the buildings were painted red, were square and rectangular, took the form of cylindrical Quonset huts, and were made of corrugated steel. The generators were whining, the power plants hummed steadily, as Stanford passed the research laboratories for meteorology and atmospheric physics, the library and medical center and radio masts, and stopped in front of the mess hut. He glanced directly above him, at the immense, glittering dome, then slapped himself to get warm and entered the mess hut for a strong cup of coffee.

It was a self-service canteen, the food stacked behind glass, plastic trays piled up beside the metal urns and the white cups and plates. Stanford poured himself a coffee, studied the food and decided against it, turned away from the steel-framed glass cabinets and looked around the mess hut. Most of the tables were empty, the men already out at work. He saw the pilot at a table near the wall, a steaming mug at his lips.

Stanford went to join the pilot, wending his way between the tables, a pulse beating nervously in his stomach, feeling bright but unreal. The pilot looked up and grinned, wiped some coffee from his beard, his hair, just like Stanford's, long for warmth, a wild gleam in his eyes.

'Hi, ho,' he said. 'How's my buddy? He don't look too good.'

Stanford pulled a chair out, sat down facing the pilot, noticed that his pupils were enlarged and did not feel encouraged.
'I'm fine, Rocky,' he said. 'Just wind me up and I'll go. One coffee – just

this single cup of coffee – and my day will begin.'
Rocky grinned and scratched his beard, inhaled luxuriously on his cigaret, blew the smoke to fill the chilly air with the sweet aroma of pot.
'Oh, my,' he said. 'Beautiful.'
'You're stoned,' Stanford said.
'Damned right, I'm stoned,' Rocky said. 'A man needs a good breakfast.'
Stanford shrugged and drank his coffee, let it burn down inside him, neither angry nor pleased with the pilot, knowing what he was like. Rocky was a freelance, working on commission for the Norwegians, a kid with scrambled brains and experience in Vietnam and the ability to fly just about anywhere, under any conditions. The Norwegians called him the Mad Bomber. He lived up to his reputation. He would do things that no other pilot would do, which is why Stanford wanted him. The other pilots avoided Neuschwabenland. It was officially forbidden to fly there. Learning that fact pretty quickly, Stanford had thought he was sunk. Then he heard about Rocky. He started to get stoned with Rocky. He told Rocky where he wanted to go and Rocky giggled with pleasure. Rocky liked the forbidden. He was just out for kicks. They had scrambled his brains in Vietnam and now he lived like a wild man. Still, he could fly. He had his own airplane. It was an old transport plane with skis attached, and Rocky knew how to handle it. He had loved the idea of this particular flight, had wanted to see them goddamned UFOs. He had, like everyone else in the Antarctic, seen them flying around. Now he had the chance to see them up close and he couldn't wait to get out there. Rocky wanted to go down in a blaze of glory, stoned out of his skull.
'What's it like outside?' Stanford asked.
'Minus fifteen degrees. I hope you've got your balls wrapped in velvet – you might lose them out there.'
Rocky grinned and scratched his nose, inhaled some more pot, the pupils of his eyes extremely large, hiding dangerous dreams.
'Can you fly?' Stanford asked.
'Zip your lip,' Rocky retorted. 'I could fly that fucking airplane through a pinhole with a girl on my cock.'
'You must have tried it,' Stanford said.
'That's my secret,' Rocky said. 'Finish your coffee and let's get out to the plane. I don't want them checking us.'
'What did you tell them?'

‘That we were flying to Cape Norvegia. I said we were picking up some supplies, and the dumb bastards believed me.’ Rocky giggled at the thought of it, finished his smoke and stood up, looking bulky in his boots and padded clothes, a pair of gloves in his right hand. ‘Okay,’ he said. ‘Let’s get the fuck out of here and have us a good time.’

Stanford gulped down his coffee, grabbed his gloves and stood up, then he and Rocky left the mess hut and headed straight for the airstrip. Stanford repeatedly glanced around him, still not used to being here, the geodesic dome soaring above him, sunlight pouring down through it. They passed the power plants and garages, then a line of snow tractors, cut around a cylindrical Quonset hut, approached a door in the curved wall. They both put their gloves on. Stanford followed Rocky out. His boots sank into the snow, the bright light stung his eyes, then the cold clamped around him like a vice and rushed into his lungs.

Ice. All ice. Hills and valleys made of ice. The sun was brilliant and it flashed off the ice and the light almost blinded him. It was incredibly beautiful. It nearly took his breath away. There was nothing out there but the ice and the dazzling white light. The ice went out to the horizon. The sky was sheer blue. He looked up at that sky and saw a green field surrounded by more ice. The sky acted as a mirror, reflecting the land below. The green field was an ice-free mass of land many miles to the west. Stanford looked all around him. The view never failed to stun him. The ice was everywhere – at his feet, up in the sky – and looking at it, he thought it was beautiful and mysterious and frightening.

They walked together across the snow, both bulky in their heavy clothing, exhaling clouds of steam, a light frost already forming on their beards, the gloves protecting their hands. The airstrip was fairly close, nestling under a towering ice cliff, its lowest peak two hundred feet above the airplanes, the sky a white haze above.

‘Fucking crazy,’ Rocky said. ‘I can’t believe we’re actually doing this. I mean, you say we’re gonna see some flying saucers, and that’s it: we’re off. We must both be fucking mad. You must be as mad as me. What the hell are you gonna do when you see them? Just answer that question.’

‘I’m going in there,’ Stanford said.

‘From what I’ve heard, that would be nuts.’

‘You can land about five miles from the mountain, then I’ll take the snow tractor.’

‘It’s really true, then?’ Rocky asked.
‘It’s really true,’ Stanford said. ‘All the UFOs you’ve seen were real, all the rumors you heard were true: there’s a colony hidden deep in those mountains and they’ve got flying saucers.’
Rocky shook his head with wonder. ‘Oh, boy,’ he said, ‘that’s great. That’s absolutely fanfuckingtastic and it’s blowing my mind.’ He giggled with pleasure, rolled his stoned eyes, the frost thickening on his bushy red beard, the sun flashing around him. ‘I can’t wait,’ he said. ‘What a wild fucking gig. What a story to tell when I’m old and gray. I won’t believe it myself.’
They were on the edge of the airstrip, a wall of ice towering above them, a fine snow drifting around their booted feet, their eyes watering with cold. A helicopter was taking off, its rotors whipping the snow up, its image reflected in the wall of ice as it climbed past the cliff. They walked across to Rocky’s airplane, an old and battered transport, its green fuselage decorated with pinups and obscene comments. The plane was resting on long skis, the door open, its ladder down, and a couple of men were standing in the doorway, their fur collars turned up.
‘All set?’ Rocky asked.
‘Smooth as butter,’ one of the men said. ‘But we better take off pretty quick. I think they’re getting suspicious.’
‘Norwegian shitheads,’ Rocky said.
‘They’re okay,’ the man said. ‘It’s just they’ve had a few complaints from the Russians. Those bastards said you’d been buzzing them.’
Rocky giggled and shook his head from side to side. ‘Lord have mercy,’ he said. ‘Them Russkies aren’t telling any lies. I buzzed Novolazarevskaya.’
The man in the airplane grinned. ‘That’s what you did, Rocky. The Russians said you were lower than their radar, almost pissing on top of them.’
Rocky giggled again. ‘What the fuck?’ he said happily. ‘A man needs a little action now and then to keep boredom at bay.’
‘You were stoned,’ the other man said.
‘Happy days, I was stoned.’
‘Some day they’re gonna boot you in the ass and send you back to Alaska.’
‘Some day,’ Rocky said.
He climbed up into the airplane, followed closely by Stanford, and they made their way along to the cockpit, past the yellow snow tractor. Stanford heard the ladder rattling, the door shrieking and then slamming, the sound reverberating throughout the airplane and making his ears ring.

‘Here we go,’ Rocky said. ‘You can take the co-pilot’s chair. The guys there, they’ll sit in the back and look after the tractor.’
Stanford nodded and took his chair, strapping himself in, surveying the control panel, the mass of switches and indicators in front of him, above him, to his right, the engineer’s chair behind him. Rocky coughed and pursed his lips, flicked a couple of switches, while Stanford looked out through the windshield at the alien world before him. All white. Everything. The sun flashed off the ice. The airplane suddenly bellowed and shuddered, prior to take-off.
‘There’s no air traffic control,’ Rocky said. ‘That’s the blessing of this burg. They just tell you what time you can leave, and then you get up and go. Hold on to your seat.’
The plane moved forward slowly, the airstrip running between banks of snow, a broad lane narrowing down to a pinpoint at the base of the cliff face. The cliff was covered in ice, the sun flashing off its face, the peaks sharply defined against a sky that changed from white haze to blue. The plane shuddered and roared, picked up speed, started racing, passing snow tractors and sun-reflecting radar bowls that were framed by the glistening snow. Then the airstrip was racing past on both sides, the white-faced cliff spreading outward, becoming higher as the plane rushed straight at it as if about to crash into it. Stanford held onto the sides of his chair, took a deep breath, released it, then Rocky giggled and the plane jumped off the runway, going into a steep ascent. Stanford kept hold of his chair. The plane was shuddering and rattling. He saw the face of the cliff, the blinding eye of the sun, then the glistening white peaks passed below and the plane leveled out.
‘Jesus!’ Stanford whispered.
‘Hi, ho,’ Rocky said. ‘Nothing like a little bit of action to get rid of the cobwebs.’
The panorama was immense, a sweeping vista of pack ice, snow falls and glinting glaciers, low mountain peaks framed against a sky of unbelievable clarity. Nothing moved in that landscape, nothing broke its frozen silence; the fierce light of the sun poured down upon it and was then devoured by it. Earth and sky became one – the sky reflected the land below – and the rays of the sun were distorted to form luminous arches. All white. Everything. The towering glaciers were like prisms. The light flashed and raced outward in silvery-white lines that merged with the dazzling white snowfalls.

‘Queen Maud Land,’ Rocky said. ‘We’re flying along the zero meridian. We should reach Neuschwabenland pretty quickly, if we don’t get lost first.’
‘What happens if we keep going?’
‘We cross the South Pole. Then north becomes south, east becomes west, and we have us a smoke and say our prayers until we run out of gasoline.’
‘Don’t get lost,’ Stanford said.
‘I’ll try not to,’ Rocky said. ‘We’ll circle over the mountains, we’ll try to find that hidden colony, then we’ll turn back and land five miles away and go in with the snow tractor, just like you suggested.’
‘You’re coming with me?’ Stanford asked.
‘Damned right,’ Rocky said. ‘I’m not giving you this trip for free, pal – I want to see all them saucers.’
‘It might be difficult,’ Stanford said. ‘There’s supposed to be a force field around the area. It’s designed to make engines malfunction and bring down the aircraft.’
‘It might be true,’ Rocky said. ‘A lot of planes were lost out there. That’s why we’re not allowed to go there anymore – and why I lied to those shithead Norwegians.’
‘So what do we do?’ Stanford asked.
‘We just stay a high altitude. That means we won’t see too much, but it’s better than nothing. We’ll land near the mountains anyway. We’ll go in on the snow tractor. We just have to see that circle of ice caps to know where we’re going.’
Stanford looked down, saw the dazzling all-white landscape, the peaks of glaciers merging with the snow, revealed only by flashing light. He felt tense and excited, a pulse beating in his stomach, closed his eyes and thought of where he had come from and still couldn’t believe it. He had left the past behind him. He could never return. He had found out too much, was a threat, and now would have to be wiped out. Stanford opened his eyes again. A vast white plain filled his vision. Looking at it, he realized that he had come to the end of the road. There was nowhere else to run to. There was nowhere to hide. If he managed to return from the Antarctic, he would find no safe place. Finally, he was trapped. He was one of the hunted. He was at the lowest point on Earth and could travel no farther. So what about Epstein? What would he do if he found his old friend? Contracts would be out on both of them and the hunters would find them. Stanford sighed and looked down. He saw a boundless white terrain. It was a

wilderness of drifting snow and ice, and might yet be his resting place. Stanford didn't really care. It didn't matter anymore. He saw the white world sweeping out to meet the sky, and suddenly felt a great peace.
'Holy fuck!' Rocky said.
Stanford followed his pointing finger, saw the radiant blue sky, great circles of white light spreading out to form luminous patterns. He was used to that by now, knew the tricks of the Antarctic, but leaned forward and looked more intently at what Rocky was excitedly indicating. Something flashed and blinked off. The rings of light framed the blue sky. He kept looking and he saw the flash again about nine o'clock high. It came and went in an instant. Before he could blink, it appeared again. This time it was much farther down: a brief flash and then nothing.
'Over there,' Rocky said, pointing. 'It's changed position… Jesus Christ, *now there's two of them*!'
Stanford followed his pointing finger. He saw two pulsating lights. They were west of the airplane, flying level with it, pacing it, two dimesized pulsating white lights in the light-streaked blue sky. Stanford shook his head to clear it. The two lights were now three. The third light had just abruptly winked on, as if it had always been there. Rocky whooped with excitement. The lights were flying in formation. They formed the three points of a triangle and kept abreast of the airplane.
'It could be nothing,' Stanford said. 'It might just be atmospheric phenomena.'
'No way,' Rocky said. 'Those lights are *moving*! Those motherfuckers are pacing us… There they go… *Wow*!'
The three lights broke apart, moving slowly, serenely, one ascending and one descending, leaving the other one between them, forming a long, vertical line. It was a precise, vertical line, pacing the plane, pulsating brightly, the three lights about a hundred feet apart, one on top of the other. Rocky whooped with excitement. Stanford just stared, entranced. The lights pulsated against the vivid blue sky and outshone the bright sunlight.
Then two suddenly exploded – not exploded: disappeared – were suddenly over and under the airplane as two large, silvery disks. The plane vibrated violently. It was sandwiched between the saucers. The saucers glittered above and below the plane and were approximately a hundred feet wide.
Then the plane just cut out. Rocky wrestled with the controls. Glancing down, Stanford saw a curving stretch of metallicgray; looking up, he saw

the base of the other saucer, a black hole right above him. It was a stark, total blackness, denying definition, so deep that it was more like a hole than anything solid. Stanford blinked and it was gone. The silent plane plummeted downward. Stanford saw the glistening snow, the glinting peaks of the glaciers, two lights streaking away to join a third, the whole sky disappearing. The plane kept diving and Rocky cursed, fighting vainly with the controls, then the engine suddenly roared back into life and the plane leveled out. Stanford saw the sky again, swinging down and then steadying; he saw the three lights streaking toward a line of mountains and then blinking out.

'Holy shit!' Rocky said.

'What the hell's happening here?' One of the crew had come up from the rear, wiping blood from his nose. 'We nearly lost the snow tractor. I nearly got my head smashed. What the hell are you doing, diving like that? That area back there was wild.'

'We had an accident,' Rocky lied.

'What the hell does *that* mean? This fucking airplane went as dead as a doornail and damned nearly killed us.'

'It's okay,' Rocky said. 'I made a little mistake. Stop worrying. It won't happen again. Don't get your balls in a knot.'

'You're fucking crazy,' the man said.

'That's right, I'm fucking crazy. Now get your fat ass back to the rear and keep your eyes on that tractor.'

The man vanished back inside. Stanford stared straight ahead. Rocky pulled the plane up, climbing gradually, gaining altitude, glancing at Stanford, his eyes large with excitement, beads of sweat on his forehead. Stanford glanced down at the mountains, saw the snowcovered peaks, stark shadows breaking up the white cliffs where great canyons divided them.

'That's it,' Rocky said. 'And that's where the saucers went. You were right, holy shit, you were right: they're hiding somewhere down there.'

'You better keep climbing,' Stanford said.

'That's just what I'm doing. Though I don't know if it'll do any good if those saucers come back. Did you see how fast they moved? And they definitely killed our engine. The plane was dead, but it just kept flying as if by pure magic. I still can't buy it. I just don't believe it's possible. But those saucers killed our engine, they somehow carried us with them, then they just flew away and let us drop – and I don't understand that.'

Rocky shook his head in wonder, pulled the plane up, kept climbing, leveled out when he felt that they were safe, muttering under his breath. They were approaching the mountains, flying high above the peaks, seeing sunlight flashing on and off the ice to form faint, shifting rainbows. There was more color there: the peaks were tinged with pink and green, the light beating off the ice to make arches of yellow and gold. The mountain peaks were free of snow, thrusting up to the sky, a white haze that faded into violet and then became azure blue. Stanford felt overwhelmed, his eyes glued to the terrain, seeing the shadows of canyons and ravines as black scars on the glaring white.

'Fuck.' Rocky said. 'We're too high. We won't see a damned thing.'

They were above the mountains now, turning west and flying along them, looking down on ink-black shadow and flashing light, an indication of ravines and ice peaks, a ribboned scar through pure white. Then the plane started coughing, started spluttering and vibrating, dipped and then picked up again, its engine malfunctioning. Rocky cursed and glanced at Stanford. They both looked down at the mountains. They saw the ribbon of shadow and light splitting in two, the two ribbons rippling outward and then returning to form a dark circle.

'That's it!' Rocky bawled.

'Yes,' Stanford said, 'that's it. And we must be on the edge of the force field. You'd better go higher.'

'Jesus Christ, can you see it?'

'Yes, Rocky, I can see it. Now let's get the hell out of her and land somewhere safe.'

Rocky shook his head from side to side, started changing direction, circling around and then heading back the way they had come, muttering under his breath. Stanford looked down, saw the circle passing under them, the boundless white terrain all around it, a blank, frozen wilderness. Then he blinked and looked again, saw two lights fanning out, streaking up from the glaciers in opposite directions, flying apart at incredible speed and then just disappearing. Stanford looked down at the mountain, saw nothing and then looked up, saw a light shooting away to the west and then just blinking out. Stanford couldn't believe it. Turning his head to look east, he saw a light ascending vertically, stopping abruptly, then racing toward him. He shouted a warning to Rocky. He didn't know what that light was. It ballooned into a massive, flaring disk that shot past them and disappeared. The plane

shrieked and rocked violently, was bathed in a blinding radiance, the light racing away and shrinking in the west and then shooting up vertically. The plane settled down again. Rocky glanced wildly around him. The same man came out of the rear and said, ‘Hey, what the fuck?’ and then the light from the west raced back again and shot past and was gone. ‘Lord Almighty!’ Rocky said. A light shot out of the east and then flared up and shot by them and disappeared. The man behind them was thrown sideways. The lights exploded over the plane and passed each other and disappeared on both sides. The man behind them was cursing. Equipment shot off the shelves and flew around and formed a shocking cacophony. Rocky fought with the controls. Stanford glanced east and west. The lights were pinpoints in the distance, flying at incredible speed, suddenly ballooning above the plane as massive silvery disks, making the plane rock, then racing away in opposite directions, becoming pinpoints again.

‘Holy shit! We can’t beat them!’

Rocky fought with the controls, trying to keep his plane steady, but was defeated every time the disks shot past and stopped as pinpoints some miles away. The plane was shrieking, rocking wildly, the holding bay now in chaos, the man behind them bawling incoherently as he rolled on the floor. Stanford looked east and west, saw the pinpoints of light, blinked and saw the huge silvery disks expanding overhead, shrinking. The plane rocked even more. It was coughing and spluttering. The disks raced back and forth, from east to west, and kept passing each other.

Stanford observed them, amazed. He hardly thought of the bucking plane. He was fascinated by the speed and capability of the two flying saucers. They raced in and shot away. Stanford tried to see them properly. He put his head back and looked straight above him, but it didn’t help much. The flying saucers were too fast. They passed faster then he could blink. He saw nothing but a flaring silvery mass that divided and disappeared. Then he looked east and west. He saw the pinpoints of light. They ascended vertically, then descended again and then were spread out above him. The plane rocked when they passed, its engine spluttering on and off, and the two men in the holding bay were bawling as equipment fell on them.

‘We’re going down!’ Rocky bawled.

The horizon rose above the cockpit, the white plains spreading out, sunlight flashing on and off the iced peaks around the edge of the mountains. Rocky tried to pull the plane up, struggling with the control column, cursing as the

plane spiraled downward, heading straight for the mountains. The flaring light fanned out above them, seemed to boil through the cockpit, disappeared as the plane shrieked and shook and went out of control. The disks appeared out of nowhere, this time passing over and under before shooting away. Stanford was stunned. The disks had sandwiched the falling plane, had passed so close he thought they would crush it, and again were mere pinpoints in the distance. The plane spluttered and kept falling. The shadowed mountains spun below them. Rocky screamed a stream of vile abuse as the mountains rushed up at them.

First the sky, then the white plains, then the spinning ink-black shadows, then the flashing of glaciers and ice caps and the deep, jagged canyons. The plane kept nose-diving, its engine spluttering, then dying, the mountains spreading out and then spinning and becoming a jigsaw. Rocky screamed his abuse. The men were bawling in the rear. Stanford looked down, mesmerized, seeing light-reflecting ice, the great snowfalls leading into the canyons of brown earth and ocher rock. It spread out and spun around them. Walls of ice shot up on all sides. Dazzling light flared up and swept through the cockpit and then became darkness.

The plane lurched and leveled out, raced along an ice-free canyon. A glowing disk, about a hundred feet wide, was keeping pace just below it. Stanford looked down, blinked a few times, then looked up. There was another enormous disk above the plane, a black, silver-edged whirlpool. The plane wasn't making a sound. The saucers made a whipping noise. They were so close to the plane, they almost touched it, and somehow they were drawing it onward.

Then the black hole was gone. The sky exploded above them. The plane roared back to life and climbed steeply toward the snow and then it was out on its own again. It left the canyon far below. There was no sign of the saucers. The plane leveled out and raced across a gleaming ice cap that surmounted a snow-covered mountain ridge. Rocky whooped and grinned wildly and grabbed the control column. Stanford glanced down and saw a round shadow racing over the ice cap. 'Shit, no!' Rocky howled. Stanford jerked his head back. Looking up, he saw a dime-sized, glowing disk, growing bigger, descending.

'*Not again*!' Rocky bawled.

First the sky, then the saucer, a black whirlpool above them, stretching out about fifty feet on either side, a swirling silver-edged glowing mass. The

plane's engine cut out. The swirling mass pressed them down. Rocky fought with the control column and then screamed more abuse. Stanford looked up at the saucer. He couldn't define what he was seeing. He was looking up at a swirling dark mass that pulsated and glowed. It defied the laws of science. It was black, yet filled with light. It glowed and was devoid of all color, had no depth, yet seemed hollow. Stanford observed it and was foiled. He didn't know what he was seeing. Then it flared up and changed, became a dull, metallic-gray, possibly spinning, its rim glowing and pulsating, racing in, shooting skyward. Stanford blinked and it was gone. Rocky's scream made him look down. The plane was just above the ice cap, flying across its glassy surface, the ice rushing up and spreading out around them and becoming a blurred white.

'*Hold on*!' Rocky screamed.

The skis screeched touching down, chopped the ice and sent it flying, a white storm that howled and raged in their ears and pummeled the fuselage. The plane bounced up and down, the skis chopping and screeching, blocks of ice and great chunks of packed snow sweeping past in boiling white clouds. The noise was hellish, almost deafening, reverberating around the cockpit as the skis chopped through the ice and dug deep and finally buried themselves. Stanford saw the spinning sky, his head exploding, stars streaming, heard more screeching and hissing and bawling, felt breathless and bruised. Opening his eyes, he saw Rocky, snow swirling outside the windshield. Rocky jackknifed, slumped over, hanging over his safety belt, then jerked upright and shook his head to clear it as the snow settled down again.

'Hallelujah! We've landed.'

He grinned at Stanford, a wild light in his eyes, then shook his head again, unsnapped his safety belt, slithered out of his chair. Stanford quickly did the same, felt various pains darting through him, twisted out of his chair and followed Rocky back into the holding bay. He saw the eyes of the other men, four wide eyes, glazed with shock, floating hopelessly in the gloom of the holding bay, a scene of chaos behind them. Rocky waved and bawled at them, pushed them, took command, not giving them time to think about it, moving quickly and ruthlessly.

'Okay!' he bawled. 'Get that ramp down! Let's get the hell out of here!'

The ramp crashed down to the snow, a dazzling brightness poured in, the two men silhouetted in glaring white, the plane filled with an icy chill.

Stanford stepped forward slowly, his bones aching, head spinning. He saw Rocky waving frantically, heard him bawling, felt the cold creeping into him.

'Right!' Rocky bawled. 'Fucking great! You're doing fine! Now let's get the snow tractor out! Okay! Move your asses!'

The silhouettes became men, heading back toward the snow tractor, light flashing in striations around them as they unsnapped the clamps. There was a sharp ringing sound, the clamps banging on the floor, as Stanford passed the men and went to the ramp and looked up at the sky. A white sheen streaked with blue, stunning clarity, no clouds; then he saw a steel-gray sphere in the sky, high up, hovering silently. Rocky bawled instructions, his voice reverberating, blending in with clanging metal, then the snow tractor, bright yellow and ungainly, slid down the sloped ramp. Stanford shivered, feeling the cold, as the two men filed past him; he stopped Rocky and pointed at the sky and saw his bearded friend nodding. They went together down the ramp, then climbed up onto the tractor. Stanford saw the other men, their eyes too big, glazed with fear, then the tractor suddenly roared and lurched forward, heading east, going nowhere.

There was nowhere to go. They were on a high plateau. The ice cap was a flat snow-white terrain that stretched around them for miles. The tractor churned the snow up. It swirled around them and soaked them. Stanford saw a white ribbon of land between the sky and the ice cap. That land was thousands of feet below them. There might be no way down. Stanford thought about that and felt only a cold, blinding rage.

'*Jesus Christ*!' Rocky hissed.

First the light, then the gloom, the snow billowing up around them, a humming, a vibrating, a savage jolting sensation, a black hole one hundred feet in diameter hovering quietly above them. One man cursed, another screamed, the tractor sliding to the left, Rocky hissing a stream of vile abuse aimed at the saucer. The saucer remained where it was, offering a faint humming sound, its base a vast black hole revolving above the tractor to create a blinding, pummeling snow-storm.

'*Fucking cunts*! *They'll just bury us*!'

Ricky bawled his defiance, pushing the tractor to its limits, grinding over the ice cap, fighting through the swirling snow, heading into a featureless white haze that offered them nothing. Stanford looked up at the saucer, at that rotating black base; when it moved to the side he finally saw its

seamless, silvery-gray body sweeping up to what he thought, vision obscured, was a solid, metallic dome. The saucer appeared to be motionless, always keeping the same distance, but in fact it was moving, inching forward, pacing the tractor, still whipping up the minor snow-storm. Rocky cursed and tried to lose it, swinging the tractor left and right, but the snow swirled and hissed and devoured them, totally blinding them.

Rocky kept going across the ice cap, heading nowhere in particular, just desperately hoping to escape from the hovering saucer and the snow it was whipping up. They were moving through an eternity, time frozen, all frozen: the tractor and the men and the landscape and the saucer above them.

Stanford saw the other two men, one cracking and screaming and shaking and frantically waving his hands. He tried to leap off the tractor, was pulled back by his friend, both falling down and rolling on the floor. Stanford shivered and looked up, numbed by cold, choked with rage, and saw the black base of the saucer as it suddenly glided toward them and then came down upon them.

Then its laser beams shot down, turning the snow into steam, two beams of pulsating light that split the ice right in front of them. The ice cracked in jagged lines, spewing steam and spinning diamonds, hissing and snapping and exploding with an earthquake's fierce venom. Rocky cursed and spun around, was flung forward, hands outstretched, as the tractor crashed down into a crevice and the laser beams vanished. Rocky spinning – Stanford saw it, his own body jackknifing, rolling over and exploding with pain, his feet finding the floor again. The tractor growled and churned the snow up, tilted downward, going nowhere, a much stronger, more devastating storm howling wildly about them. Stanford stood up, felt lost, heard a wretched, shocked sobbing, saw the dark mass of the saucer just above, now obscured by the swirling snow. The sobbing turned into a scream, a pair of hands waving frantically, the man pushing his friend to the floor, then falling over the side. Stanford saw him, did nothing, thought of nothing, felt dreamlike, was pushed forward by a pair of strong hands and urged over the side. He dropped into the snow, was whipped by it, numbed totally, saw the dark mass in the sky, the three shadowy forms just ahead, stumbling blindly and bawling.

First the wind, then the snow, then the dark mass, then the whiteout, then the running, crouched low, seeing nothing, then the beam of pulsating light. The beam swept across their path, and they ran, leaping forward, heard a

scream and turned around and saw a man sinking down, disappearing. The ice snapped and the chasm widened, falling a thousand feet, and they turned away and plunged into the storm, the great saucer above them. Stanford heard another scream, couldn't tell one man from the other, saw a rigid beam of light beaming down upon a dancing silhouette. The man quivered and spun around, his face briefly illuminated, then he jerked and fell back, his eyes bright in the light, and the snapping ice split and opened wide and then swallowed him whole.

Stanford turned back and ran, turned right and saw the other unknown man as a shadowy form. They fled together, as one, moving blindly, not thinking, pushed onward by the dark mass above them, each leaning on the other. Then more beams of light shot down, the lasers cutting through the ice, the ice snapping and hissing and streaming and exploding around them. They both stopped, feeling trapped, both alone with a shadow, then they moved again, running around the beams of light, the snow flaying their skin. Too late: they saw the end. A beam of light shot between them. Stanford jumped back and stumbled and fell and heard the other man screaming. Then darkness, the snapping sound of ice splitting, the dying echo of the man plunging down a thousand feet to his death. Then silence. And nothing.

Stanford lay there on his back, the snow settling around him, his skin numb, his bones aching, head spinning, the brilliant daylight returning. He observed the saucer descending, no longer glowing, enormous and very real in the sunlight, descending gently and quietly. Stanford sat up, fell back, pressed his hands into the snow, gasped and turned onto his belly, saw the radiant blue sky. He was near the edge of the ice cap, a thousand feet above the lowlands, his eyes drinking in a stunning panorama of white, frozen wilderness. It was too much, too blinding, too remote to be real, and he sighed and rolled onto his back and then forced himself upright. The saucer was there before him, its seamless sides sweeping up to a large steel dome, resting lightly on the snow of the ice cap, the sun flashing around it.

Stanford studied the saucer. He felt cold, but very calm. He sat there on the ice, in the snow and the silence, a white wilderness one thousand feet below, a radiant blue sky above. Stanford sat there and waited.

Chapter Thirty-Five

Stanford waited a long time, his eyes fixed on the gleaming saucer, the snow drifting lazily around him, the silence unbroken. The saucer seemed enormous, its sloping sides a seamless gray, sweeping up to a solid metal dome. The dome was thirty-five feet high, the saucer three times that in width, sunlight beating down and flashing off its gray surface and turning it white. All white. Everything. The land and sky looked the same. There was no definition, no sense of direction; just a glaring, white void all around him, that stark, total silence.

The saucer didn't move, made no sound, offered nothing, was simply spread out across the ice cap as if actually part of it. Stanford sat there and studied it, feeling cold but very calm, occasionally squinting into the white haze on all sides, a light frost gradually covering him. The saucer still didn't move. It made no sound at all. After a long time, feeling the cold eating at him, Stanford climbed to his feet.

His bones were bruised and aching, his skin numb, his head light, and he stood there for a moment, uncertain, the snow drifting about him. Then he walked toward the saucer, feeling small, slightly unreal, stopped a few feet away from its near edge and saw it towering over him. He stared at it with wonder. The steel surface swept up to the dome, exceptionally smooth, totally seamless, curving back down and then under its edge, becoming part of the base. There were no doors or windows, no visible lights. He looked up at the solid metal dome, but it was vague in the white haze. Stanford stood there, bemused. The saucer filled his line of vision. He stepped forward, stopped close to the curved edge, then reached out and touched it.

The metal felt like sandpaper. Stanford ran his fingers across it. He felt air, or he thought he felt air, and then he stepped closer to it. The metal was porous, the holes smaller than grains of sand, scraping almost imperceptibly against his fingertips and releasing trapped air. Stanford smiled and looked closer, examining the curved edge; he saw fine, nearly invisible lines crisscrossing each other. The lines formed various rectangles, some small, others large, sweeping up to the base of the metal dome, dissected by other lines. Stanford studied them at length. He heard a low-pitched humming sound. Panels slid upward around the sloping edge to reveal hidden lights.

Stanford stood there, not moving. The lights were covered with convex glass or Perspex, various colors, thick and opaque, with a very slight ripple finish. None of the lights were on. The low-pitched humming sound grew louder. A series of panels slid upward where the sloping surface was almost vertical, revealing a long, rectangular window that curved around the whole body of the saucer. The windows were illuminated with violet light, then this color changed to a whitish yellow. A group of shadowy, human-shaped figures were lined up along the window, obviously staring down at him.

Stanford stood there, waiting patiently. He heard a muffled hissing sound. A large section of the curved wall moved forward, tilting back from its top edge. It slid out on large steel hinges, tilting backward, moving forward, its front edge eventually touching the ground, its back edge still inside the saucer. The section of wall was now a ramp, leading up into the saucer. Stanford studied the wide, rectangular opening and saw a white wall beyond it. The men at the windows were looking at him. The windows were well above the door. Stanford smiled and then walked up the ramp and found himself in a corridor.

The inner wall was white and blank. There were windows on the other wall. These windows were behind the gray shell of the saucer's body, or fuselage. The corridor curved away from him and obviously ran around the saucer. He then heard a sharp hissing sound and the door closed behind him.

He stood there in the corridor. He waited, but no one came. There was a muffled humming all around him, above him, below him. Intrigued, he started walking. He felt no fear at all. The humming sound was filling his head and it helped him relax. The corridor curved around the saucer, its white walls and ceiling arched, then a door slid across the space directly in front of him, forcing him to stop walking.

There was a room to his left, white walls forming a perfect circle, broken up by the rectangular windows at which the men had been standing. A small hunchbacked man approached him, waving an unusually delicate hand, inviting him in. Stanford stepped into the circular room and stopped close to the hunchback.

‘You’re all right?’ the hunchback asked.
‘I think so,’ Stanford said.
‘I’m Ruediger,’ the hunchback said. ‘Please don’t worry. We will

take you down now.’
Stanford gazed around the room. It was shaped like a large dome. The walls were covered with control panels and consoles and what looked like computers. There were eight men in the room. They were uncommonly small. Some were young boys, others were Ache Indians, three were fair-skinned and middle-aged. About half of them wore masks that were made of thin metal, covering their noses and mouths, molded close to the skin. Stanford studied them, fascinated and horrified, realising that they were cyborgs: part men, part machine. The boys and Indians were at the consoles, seated in chairs fixed to the floor, the control panels flickering. The other men studied Stanford, not smiling, their eyes dead, then they turned away and sat in other chairs, turning knobs, pressing buttons, flicking switches. The computers started flashing. The muffled humming sound grew louder. Stanford felt a light vibration, *thought* he felt it, wasn’t sure, then he looked down at the small man with the hunched back, saw his upturned brown eyes.
‘Come,’ the hunchback said. He was smiling and indicating with his hands. The hands had an unusual delicacy, a feminine grace.
‘Come,’ he said. ‘I will show you.’
He led Stanford across the floor, up some steps to a raised platform, the floor running right around the dome, above the computers and consoles. The long windows were there. Stanford stood beside the hunchback. The ice cap was shrinking beneath him, blending in with the mountains, the glittering snowfalls of the wilderness spreading out until they encompassed the horizon. The saucer was ascending, climbing vertically, leisurely, then it stopped, or seemed to stop – Stanford didn’t feel a thing – then it moved horizontally, as if flying backward, and then descended again.
There was no sense of motion. The saucer descended at the speed of an elevator, falling into the mountains. The mountain peaks climbed up around them, first the rock, then blocks of snow, then the sheer, towering walls of blue ice, turning green, disappearing.
They were moving faster now. The saucer was flying horizontally.

Walls of algae and plankton, moss-covered rocks splashed with white, were sweeping past on both sides of the saucer as it raced through a canyon. There was still no sense of motion. Stanford thought he could feel a light vibration. Looking down, he saw the rim of the saucer, metallic-gray in a pulsating, glowing haze. Then he looked ahead again, saw the canyon walls parting, opening out around a lake, the lake whipping out of sight, more snow, more brown earth, a rich green spreading outward, then an immense, round valley, its white cliffs soaring skyward, the ice flashing and fading away above the earth and then becoming pure rock. The saucer flew across the valley, the green earth rushing at them, then the rushing earth slowed down, almost stopped, then rose gently to greet them.

Stanford didn't feel a thing. There was no sense of movement. The saucer drifted, or appeared to drift, across the wide valley, heading toward the towering cliffs that surrounded it and cast gigantic shadows. The hunchback raised a hand and pointed. Stanford stared straight ahead. He saw the mouths of large natural caves at the base of the icefree cliffs.

'We go in there,' the hunchback said.

Stanford glanced at the rim of the saucer, saw the pulsating glow dying, the panels around the rim opening to expose all the lights. Then the lights started flashing, left to right, right to left, a kaleidoscope of green and blue and orange and violet, flashing right around the rim of the saucer as it moved slowly forward. The caves expanded as they approached, became enormous dark tunnels, and the saucer glided into a tunnel, its colored lights flashing on and off. Stanford saw natural rock, the glint of moisture and green moss, then saw a pinpoint of light far ahead, growing bigger each second. First a pinpoint, then a dime, then a glowing balloon, then a round exit racing at them and pouring light over them.

Stanford saw another valley, almost roofed in with cliffs, the rocks forming an umbrella above, the sun beaming through crevices. The valley floor was far below, broken up by silvery domes, some minute, others looking quite large, the ground around them a deep brown. The saucer hovered and then descended, dropping slowly, almost leisurely; it appeared to bob up and down gently, yet Stanford felt nothing. He looked down on the silvery domes, at first mistaking them for geodesic domes, but

then saw them rising up and becoming larger and taking shape as parked saucers. Stanford stared at them, bemused. The valley was spread out around him. The saucer dropped past a soaring wall of glinting metal, and Stanford, looking back, saw a flying saucer as big as a cathedral: one of the legendary carrying ships.

The saucer touched down gently. The hunchback looked up and smiled. Stanford gazed through the window, saw a large square steel platform, the flashing lights around the saucer's rim blinking out one by one. The metal panels slid back down, leaving the saucer's body, the fuselage, looking smooth and seamless once more. The steel platform was above the ground, thrusting out from the face of the cliff, fronting a tunnel from which a group of men emerged, bareheaded, wearing coveralls. They were all big men, their lower half of their faces in silvery masks, and they pushed a mobile lounge against the saucer as its door angled downward. The door was swallowed by the mobile lounge. The lounge was pushed against the saucer. Its angled edge had been perfectly contoured to the saucer's sloped surface.

'We go out now,' the hunchback said.

Accompanied by a cyborg guard, he led Stanford down the steps, across the dome-shaped white room, past the adolescents in coveralls, the Ache in the chairs, their mouths and noses sealed and rendered useless, their narrow eyes dulled and fathomless. Stanford, now accepting them, almost thinking of them as normal, left the room with the hunchback, followed him back along the curving white-walled corridor with its row of sealed windows. They turned onto the ramp, the lounge's ceiling arched over them, the walls and floor painted white, the windows framing solid rock, passed through the lounge and continued along a tunnel with invisible lighting. The tunnel was quite long and had been hacked out of the rock; it ran into the bowels of the mountain and was surprisingly warm.

As Stanford followed the hunchback, he studied his strange hands, took note of their uncommon, almost feminine delicacy, the crude contrast of powerful arms. Then they left the tunnel, stepping into brilliant light, crossed a catwalk high above a workshop of impressive dimensions. Stanford saw jibs and cranes, a lot of roaring machines, sheets of metal, dull-gray and all shapes, being swung to and fro. There were hundreds of workers down there, steel benches, steaming vats, blast

furnaces and screeching electric drills, immense saucer-shaped skeletons.

Stanford stopped to see more, but was pushed forward by a cyborg, saw an oblong metal plate in his fist, was touched by it and received a shock from it. It was a sharp electric shock, jolting painfully through his shoulder, and he hurried onward, still following the hunchback, his arm stinging and burning. They passed through another tunnel, crossed a steel-plated room, rows of frosted-glass cabinets on the shelves, naked bodies inside them. Stanford stared at them, startled, felt the chill in the room, then recovered and followed the hunchback through a door that led into another room.

This room was a laboratory, steel-plated, quite large, the walls rising to a ceiling of chiseled rock that was part of the mountain. The staff looked perfectly normal, men and women in white smocks, reading and writing, peering into microscopes, checking printouts and gauges and thermometers, working quietly, intently. What was different were the specimens in the cages and glass jars: human heads, pumping hearts, floating brains and intestines, a naked body sitting upright in a chair, a wire frame where its head should have been. The frame was shaped like a human head, was made from crisscrossing wires, contained flashing bulbs and fuses and copper coils, wires and tubes running out of it. The wires and tubes ran to a console, were plugged into various sockets, the console flashing and buzzing, activating the headless body, its arms rising and falling, legs kicking: a puppet of flesh and blood. Stanford quickly turned away, saw the hunchback smiling at him, felt the sting of the electric fist in his back, so followed the hunchback through another door.

They passed through a kind of warehouse, its walls hacked out of the mountain, refrigerated and couched in semidarkness, filled with tables and cabinets. Stanford tried not to look, was fascinated and horrified, his head level with the cabinets, the tables on all sides, his eyes drawn against their will to what was present: the nightmare of scientific progress.

The cabinets kept the flesh frozen, arms and legs, hands and feet, wires extending from bloody necks and stumps, electrodes sprouting from sliced skulls. The tables were even worse, the human subjects not completed: here a steel chin and nose, there a woman with plastic

breasts, here a torso with metal legs, valves and tubes instead of genitals, there a chest with the skin peeled off the bone, its hydraulic heart pumping. Other cabinets contained the hardware: the exoskeletons and pacemakers, the percutaneous power connections, the bifurcated blood vessels and aortic valves and silicone boosters, the orthopedic braces and cobalt joints and piezoelectric generators – the stainless steel and chromium, the meat and bone, of those picked to be cyborgs. ‘Jesus Christ,’ Stanford whispered.

The metal fist thumped his spine, the electric shock stabbing through him, and he gasped and followed the hunchback past the tables, the cyborg padding behind him. They went through another doorway, passed more bodies in cabinets, the glass frosted, the graph needles not moving, and then came to yet another door. The hunchback stepped aside, bowed to Stanford, waved at him, and Stanford stepped through the doorway and was dazzled by bright light and plate glass. He was in a dome-shaped room, its white metal walls gleaming, large windows running around the curved wall, framing clear sky and mountain peaks. There were doors between the windows, steel-plated, all closed, large consoles jutting out just above them, their lights flashing on and off. The room was about fifty feet wide. There was a desk in the middle. On the desk there was an intercom, a Micro-film viewer, a pile of books, pens and pencils, notepaper, a black panel of switches. There were chairs in front of the desk, all white, deep and comfortable; there was no other furniture in the room and the floor was cold plastic. A man sat behind the desk. He was staring steadily at Stanford. He was handsome and white-haired and slim, and he waved Stanford forward.

Stanford crossed the cold floor, his footsteps reverberating. It seemed to take a long time to reach the desk, but he got there eventually. He stopped and stared at Wilson. He had no doubt that it was Wilson. Stanford saw the unusually seamless forehead and knew who he was talking to.

‘Mr Wilson,’ he said.

‘Yes,’ Wilson replied. ‘You’ve come a long way to see me.’ Stanford didn’t smile. He hadn’t smiled in a long time. He rubbed his beard and looked at Wilson’s blue eyes and was reminded of the Antarctic ice.

‘This is it,’ Wilson said. He waved his hand in a careless manner. ‘Those doors lead out to the colony, to all the different departments; the consoles tell me what’s going on and I control it from here. The colony forms a sort of circle. The tunnels run right through the mountain. The tunnels are the spokes of the wheel, and this room is the hub. We’re at the top of a plateau. The tunnels lead down to the bottom. The saucers and construction plants are down there, and can’t be seen from the sky. This room constitutes the highest point. Overhanging rocks hide it. I have lived here for more than thirty years and I find it inspiring.’ Wilson offered a bleak smile, his blue eyes as cold as ice,
brightened with a luminous intelligence that did not show emotion. There was no malice in him. Stanford sensed that immediately. Wilson knew neither malice nor fear: he had gone beyond all that.
‘You know who I am?’ Stanford asked.
‘Naturally,’ Wilson said. ‘We’ve been watching you and Epstein for years; you were both too persistent.’
‘Where is he?’ Stanford asked.
‘You’ll see him soon,’ Wilson said. ‘Dr Epstein is healthier than he was – and is really quite happy.’
‘Happy?’
‘Yes, happy,’ Wilson said.
‘What the fuck did you do to him?’ Stanford said.
‘I just offered him life.’
Wilson smiled and stood up, crossed the room to the window, his movements excessively slow and careful, then stopped and looked out. All white. Everything. The Antarctic was spread out far below. He turned away from the window and looked at Stanford, his face smooth and expressionless.
‘Why did you come here?’ he asked.
‘I came for Epstein,’ Stanford said.
‘No,’ Wilson said, ‘I don’t think so. That doesn’t make sense.’ ‘Why not?’ Stanford asked.
‘You must have known you couldn’t go back. You knew you couldn’t get in here unless we let you enter – and you knew that you couldn’t escape. You must have known that and yet you still came… It wasn’t just for your old friend.’
‘Partly that,’ Stanford said.

‘And the other part?’ Wilson asked.
‘I don’t know,’ Stanford said. ‘I’m not sure. I guess I just had to finish it.’
Wilson smiled without humor. The smile didn’t reach his eyes. He went around the desk and sat down, his gaze still fixed on Stanford. ‘You’re living dangerously,’ Stanford said.
‘I’m not sure I understand.’
‘We’re all alone here,’ Stanford said. ‘I could kill you. And I think I might do it.’
‘I don’t think so,’ Wilson said. ‘You didn’t come here for that. Besides, it would serve little purpose: it would not affect this place.’ ‘You’re not concerned for yourself?’
‘Not really,’ Wilson said. ‘I’ve had a long life, a full life, but it can’t last forever.’
‘You’re a cyborg,’ Stanford said.
‘Not quite accurate,’ Wilson said. ‘I have an artificial heart, a few joints are prosthetic replacements, my face has undergone plastic surgery, but I’m hardly a cyborg. Not that it makes much difference. Even cyborgs pass away. We still haven’t conquered the liver, and that means we’re still mortal.’
‘How long have you got left?’
‘A few more years,’ Wilson said.
‘Then what? What happens when you die?’
‘This place will continue.’
He stared steadily at Stanford. His eyes radiated no feelings. He displayed neither malice nor warmth, his soul destroyed by intelligence.
‘Man is simply a tool,’ he said. ‘He is the seed of evolution. He exists to explore and create, and has no other value. But men alone are self-destructive. Without discipline they rot. Take the history of man and examine it and you come up with lunacy. Wasted time and opportunity, self-indulgence and corruption, material greed and self-pity and vanity – all negative impulses. The will to freedom has never worked; every success has been matched with failure; we step forward and then we step back and wallow in pettiness. Our superiority is in thinking. Only the mind has any value. But our animal needs, our appetites and fears, keep us chained in self-imposed imprisonment. We must leave the cave behind us. We must reach for the stars. We can’t do

that while Democracy persists and lets freedom destroy us.' 'Freedom leads to creativity.'
'No, it doesn't,' Wilson said. 'Freedom leads to boredom and conflict and waste – and encourages stagnancy.'
'The world hasn't stagnated.'
'It hasn't advanced much,' Wilson said. 'Or, at least, it's only advanced on one level and is now dangerously imbalanced. We have advanced scientifically, have made extraordinary leaps forward, and now we stand on the brink of the miraculous and can reshape man's future. But that advance was intellectual. We're still emotionally retarded. The other side of man is still as primitive as it was in the cave. That side remains unchanged. It hides the dire results of freedom. It disguises mindless greed, political suspicion and social fear, pointless hatred and the boredom and resentment that lead to destruction. The world is wallowing in bloodshed, the atmosphere's being polluted, we're gradually gobbling up our natural resources and inviting a barren Earth. We do this because of greed, because of politics and war, and these things are the consequences of so-called freedom, the fruits of Democracy. Man must have a purpose. He must be disciplined and driven. Only then will the world become sane and save itself from ruination.'
'Totalitarianism,' Stanford said. 'A world of masters and slaves. The people will be content because they're zombies… and the Earth will be peaceful.'
'You disapprove,' Wilson said.
'Damned right, I disapprove. It's obscene and it's been tried before and it just never works. A man needs free choice. Without that, he's not a man. To steal a man's will and contradictions it to steal his humanity.'
'That's sentiment,' Wilson said.
'I'm a sentimentalist,' Stanford said.
'You're a primitive,' Wilson said. 'You're self-destructive. That's why you came here.'
'Fuck you,' Stanford said. 'What you're saying is shit. And you won't get away with it forever – the world out there won't let you.' 'Won't it?' Wilson said. 'How naive you are, Stanford. The world out there is part of the conspiracy – and has been for years. The United

States knows about us. The Soviet Union knows about us. The British and the Germans know about us, and all of them deal with us. What I have is what they need. What I'm doing is what they want. The world is out of control, freedom has led to revolution, and now Democracy is no more than a name to keep the innocent happy. You think your people are any different? No, Stanford, they're not. Totalitarianism creeps over the world and is stifling resistance. Regimentation is increasing. People are numbers instead of names. The world is now ruled by a selected few, and suppression is spreading. Surveillance is widespread. Every citizen is on file. The salient facts of every individual human have been fed to computers. Television mesmerizes them. Piped music fills their factories. Credit cards and employment cards and passports have rendered privacy obsolete. All these people are mere numbers. Their socalled freedom is an illusion. Their politics, their culture, their religions have no bearing on anything. Let them demonstrate occasionally. Let them criticize and abuse. Feed them issues that will keep them engaged while the real work goes on. In the end, they'll be passive. They won't really have any choice. Their credit cards and employment cards and passports can be withdrawn at any time. Such items make or break them. A select few decide the issue. The mass of men are led by the nose and they don't even know it. That's your freedom, Mr Stanford. That's your precious Democracy. The world is a chess game, the pieces are property, and the game is only played by the select few who hide behind closed doors.'

'A neat theory,' Stanford said. 'But it has one glaring flaw. Your players will fight amongst themselves, and you'll still have world conflict. The Americans want you out of here. The Russians want you out as well. They're human beings and they're filled with the suspicion and fear that you loathe. You won't have peace on Earth. They're just playing for time. When they're ready, or when they *think* that they're ready, they'll come at you with everything. You just said it yourself: they're not logical creatures. They're human beings and they're moved by primitive fears – and that's the flaw in your scheme. Sooner or later, they'll try it. It might be madness, but they'll try it. Then the war that will come, caused by you, will be the war to end wars.'

'You're wrong,' Wilson said quietly. 'I've made allowances for that. I'm not so naive as to imagine that this race can continue. The race

will *not* continue. It will end in ten years time. Within ten years every major government post will be run from this colony. We have people everywhere, in every country, in every government, and those people have electrodes in their heads and will do what we tell them. They are currently in the Pentagon, in the CIA and FBI, in NASA and the Cheyenne Mountain Complex, in the Army and Navy and Air Force, in every top-secret project. It's the same all over the world. We have our people everywhere. We're robotizing important people every year, and every year it gets easier. They don't know they're robotized. They believe they're making their own decisions. But every new law of suppression, every new surveillance system, every action that changes the course of world events is dictated by us. We grow more numerous every month. We're gradually climbing up the pyramid. In ten years – or possibly less – all the rules will be our rules. Your world is ending, Stanford. It will soon be no more. If I sent you back out there tomorrow, it would do you no good.'

Stanford didn't know what to say. There was nothing left to say.

He hadn't experienced emotion for months, but now he felt it returning. That emotion was fear. It might well have been despair. He gazed down at the man behind the desk and saw the ice of his blue eyes. Those eyes were devoid of feeling. No malice, no resentment, no greed… It was organization.

Stanford thought this and was shocked. He thought of the world beyond the mountains. That world, his own world, was procreating and becoming too complex. The cities couldn't be controlled, the great suburbs were a mess; inequality and boredom and frustration were leading to madness. Increasing violence and civil strife, increasing wealth and attendant poverty; the contradictions of society were exploding and destroying whole nations. The politicians were defeated: freedom foiled them every day; more and more they were introducing legislation that encouraged suppression. They didn't appear to have much choice. Increasing chaos overwhelmed them. Categorization and surveillance and harassment were all they had left. Stanford thought of it with woe. He desperately wanted an alternative. He felt human for the first time in months and he was paying the full price. The fear chilled him and shook him, turned into bitter rage. He looked at Wilson and felt the first stirrings of a cold, hard defiance.

‘Where’s Epstein?’ he asked.
Wilson reached across the desk, flicked a switch and then stood up. He led Stanford across the room to a door, not saying a word. Stanford looked above the door. A red light flashed on a console. He turned his head and looked out through the window at the Antarctic wilderness. The panorama was stupendous: the white plains stretched to the sky; the jagged mountain peaks were just below, their rocks ringed with blue ice. Then the steel door slid open. Wilson waved Stanford in. They stood together in the white-walled elevator and the doors closed in front of them.
The elevator descended quietly, dropping down through the mountain. Stanford thought of what the German had told him about Hitler’s teahouse. He saw a window in one wall. Floors slid upward and disappeared. There was hardly any sound, no sense of motion, and the elevator was comfortably warm. Wilson didn’t say a word. He studied Stanford with detachment. Stanford saw a huge cavern, littered grottoes and caves, various workshops and storerooms and offices, people working in silence. The elevator door slid open. They stepped out into an office. The walls were painted white, the shelves were packed with books, and Professor Epstein was sitting behind a desk, looking up, smiling distantly.
‘Hello, Stanford,’ he said.
Stanford studied his old friend. Epstein did indeed look healthy. He had put on some weight, his gray beard had been trimmed, and he was wearing a shirt and tie, a white coat, his cheeks ruddy, his eyes clear.
‘I’ll leave you now,’ Wilson said. ‘I hope you come to an agreement. You’ll have to make a decision, Dr Stanford, and I hope it’s the right one.’
He turned back to the steel door, the door opened and he stepped in, then the door closed and Wilson was gone, leaving silence behind him.
Stanford studied his old friend. Epstein stayed behind his desk. His hands were clasped under his bearded chin, his eyes clear and steady. ‘It’s good to see you,’ he said.
‘Is it?’ Stanford asked.
‘It’s been a long time,’ Epstein said. ‘It seems more than a year.’ ‘What

happened to the cancer?'
'They cured me,' Epstein said. 'They're really quite extraordinary that way. I must say I was grateful.'
'Grateful?' Stanford asked.
'A new life,' Epstein said. 'Not just that, but new purpose, new work… Something worth living for.'
Stanford looked at his old friend and a felt a searing anguish, a despair that came out of his very bowels and made him feel lost. 'What did they do to you?' he asked.
'They did nothing,' Epstein said. 'They cured me of cancer and explained what they were doing, and I realized that their work was important and decided to stay.'
'They did an implant,' Stanford said.
'Not on me,' Epstein said.
'Either you're lying or you simply can't remember. They must have done *something*.'
'They did nothing,' Epstein said.
'Jesus Christ,' Stanford said.
'Believe me, they didn't do a thing. They just talked and I listened.'
'And this is what you want?'
'Yes, it's what I want. They took me up above the Earth and showed me things that I just can't forget.'
'They did an implant.'
'Not in me.'
'They do it to everybody,' Stanford said. 'They must have done it to you.'
'They didn't.'
'You don't remember.'
'I don't remember because they didn't do it. I just want peace and quiet now.'
'I'm taking you out of here,' Stanford said.
'I won't go,' Epstein said. 'The very thought of it gives me a migraine. I just don't want to go.'
'A migraine?' Stanford asked.
'The thought of outside,' Epstein said.
'They did an implant.'

‘No, they didn’t,’ Epstein said. ‘I just don’t want to go.’ Stanford felt hot and clammy, swept with anguish and despair, a hopelessness that threatened to drown him and choke off his resistance. He thought of Jacobs and Gerhardt, of the girl near Galveston, of Scaduto and Epstein and himself and all the years now behind them. The mystery was resolved. The nightmare was manifest. The world was being saved from itself and taking on a new face. Stanford wanted no part of it. He didn’t want to lose himself. He wanted to live with his contradictions and conflicts and the pain of free choice. Yet the price was too great. He didn’t know if he could pay it. He looked down at his old friend, Professor Epstein, and the pain slithered through him. Professor Epstein was no more. His placid eyes were all-revealing. His gazed at Stanford without malice or friendship, offering nothing and everything. Stanford shook with grief and rage. He let his senses fly away. The pain took him apart and just as quickly put him back together and gave life to defiance.

‘You must stay here,’ Epstein said. ‘We need people like you. You will work and know great satisfaction and never feel discontentment.’ ‘I don’t want it,’ Stanford said.

‘You must accept it,’ Epstein said.

‘You’re not Epstein,’ Stanford said. ‘You’re someone else. You’re not the person I knew.’

‘I’m the same,’ Epstein said. ‘They just cured me of the cancer. Now I do the kind of work I always dreamed of – and feel wonderful with it.’

‘They’ve stolen your mind.’

‘That’s ridiculous,’ Epstein said. ‘I know you. I remember my past. I know just who I am.’

‘They’ve stolen your will.’

‘They’ve stolen nothing,’ Epstein said. ‘They just talked and I listened and that’s all. They did not operate.’

‘You can’t remember,’ Stanford said.

‘I’m getting a headache,’ Epstein said. ‘We really must stop talking about this. You must stay. You can’t leave here.’

Epstein’s gaze was placid. His hands were folded on the desk. He looked at Stanford with a calm, remote interest, talking quietly and patiently.

‘You can’t leave here,’ he repeated. ‘There’s really no place to go. You can walk out whenever you wish, but you’ll freeze to death out there. Here you’ll live a painless life. Your life will take on some meaning. You might be deprived of your imagined freedom, but think of the blessings. No more discontentment. No decisions to be made. You will work and take pleasure in that work and never know doubt or fear.’

‘I’ll be robotized.’

‘They won’t do that.’

‘They did it to you,’ Stanford said.

‘No, they didn’t. They didn’t.’

Stanford knew it was useless. His feeling of loss was overwhelming. He let the grief and rage shake him loose and make him fight for his freedom. It didn’t matter where he went. He didn’t give a damn what happened. The point now was to make a decision and then follow through on it.

‘You said I can leave.’

‘That’s correct,’ Epstein said. ‘We won’t stop you, but we won’t help you either. The decision is yours.’

‘I want to leave.’

‘You’ll freeze to death,’ Epstein said.

‘Fuck you,’ Stanford said. ‘Fuck you all. I won’t submit to this shit.’

Epstein sighed and stood up. He walked to the nearest wall. There were large curtains drawn across the wall, reaching down to the floor. Epstein tugged on a sash cord. The wide curtains drew apart. A dazzling light poured through a plate-glass door and washed over both of them. Stanford blinked and rubbed his eyes. He was looking along a hall of glass. Through the glass walls he could see the glaring white of the immense, frozen wilderness.

‘The choice is yours,’ Epstein said. ‘You can stay or you can leave. However, once the decision is made there can be no turning back. You just have to touch this door. It will open and let you through. Once you step into the hall the door will close and trap you in there. You can only leave by the other door. It’s at the far end of the hall. That door opens by contact from inside, and leads out to the wilderness. You can’t open it from outside. If you step out, you have to stay out. You can

leave or you can stay – as you wish – and you must decide now.' Stanford looked at his old friend, at his gray, remote eyes, mutely prayed for some sign of emotion, but received calm indifference. The feeling of loss was overwhelming, the pain unprecedented, shaking Stanford and making his heart pound, leaving nothing but rage. He would hold the rage and use it. He would make his decision.

Neither old friends nor memories nor hopes would make him bend to their will. He was not a machine. He would not be a cipher. Stanford looked along the hall, saw the dazzling sunlight, saw the white haze running out to the sky and then pressed on the plate glass. The wide doors slid apart. The glass hall was filled with light. Stanford stared at his old friend, at his gray eyes and beard, thought of all that they had been through together and dissolved into anguish.

'You're not Epstein,' he said.

He stepped into the hall. The plate-glass doors closed behind him. Sunlight blazed through the glass walls and roof to form dazzling mosaics. Stanford zipped his jacket up. He covered his ears with his woollen hat. He put his hands in his pockets and stepped forward, determined not to look back. The past was now behind him. The hall stretched out to the future. Stanford saw a globe of fire fill the sky with lines of silver and pink. He walked quickly along the hall. The flashing glass was all around him. He reached the door at the far end of the hall and stopped a few feet away from it. Stanford wanted to say something, wanted to speak to the silence, but he stepped forward and the glass doors slid open and the fierce cold rushed in.

All white. Everything. The cold was appalling. Stanford leaned into the wind and stepped forward as the doors closed behind him. He didn't stop or look back. The white wilderness lay before him. The wind blew the snow in languid, glinting clouds across the pack ice and glaciers. Stanford kept moving forward. He didn't care where he was going. He saw an arch of light above a horizon that forever receded. All light. Flashing light. A unique and dazzling vision. The light flashed and made his eyes sting and weep. Stanford didn't give a damn. He felt defiant and proud. He was alive and he kept moving forward to disprove all their theories. He saw a monstrous balloon. It was floating there before him. The balloon was transparent and it shimmered and framed a pink sky. Stanford shivered and stumbled. He had to clench his chattering teeth. The wind moaned and

made the snow swirl around him and settle upon him. He ignored it, kept going. His teeth began to ache. The snow settled on his beard and his face and then formed a light
frost.
All white. Everything. Definition was lost. The wind moaned and the snow blew all around him and made him a part of it. He fell down and stood up and stumbled forward again. He thought of Epstein and Wilson and the colony and the great flying saucers. The future was here and now. His own time had passed. The snow formed immense darkened portals that were luring him in. He stepped in and saw a light, stumbled forward and watched it grow. The snow hissed and swirled and then the shimmering bright light exploded. All white. Everything. He let the wilderness embrace him. Glinting glaciers and flashing pack ice and streams of yellow and violet. The frost thickened on his face. He couldn't feel his numbed lips. The hands deep in his pockets had vanished and left shrieking nerve ends. Stanford laughed as he froze. The icy air filled his lungs. He stumbled onward, heading into the wilderness, and would not be defeated.
He went out a long way. The mountains fell far behind him. The white wilderness stretched out on all sides and offered no exit. Stanford didn't give a damn. He thought of what he had left behind. The future that would rise from the ice held no promise for him. Stanford's lips cracked when he smiled. His blood froze on the instant. He moved onward with his weeping eyes stinging, his hands and feet missing. No feeling. All numb. The ground shifting and sliding. A great rainbow appeared above the horizon and framed a fierce whiteness. Then a luminous balloon. A mirage: a sun dog. He saw miracles of blue ice and light, the dazzling wastes of the snowfalls. Stanford stumbled on, regardless. He started talking and singing. He heard a voice that was offering comfort and coaxing him onward. He followed the Pied Piper. He let the sun and snow dissolve him. He fell down and saw the huge slabs of pack ice that drifted and glittered.
He would travel, he would move. He crept along on his belly. His frozen fingers found the snow and dug in and his body inched forward. Stanford saw the drifting ice. He sang and muttered under his breath. Jagged black lines on white glare. A giant jigsaw in the sun. Stanford felt a fierce defiance and exultation that would not let him die. He

crawled across the frozen earth. He dragged a dead thing behind him, his body, and would not let it go. Stanford slithered across a crevice. His fingers touched a slab of ice. The ice glittered and reflected the sun as the swirling snow settled down. Stanford muttered and sang. He heard someone singing somewhere. His fingers touched and felt nothing and bent as his body inched forward. Stanford saw streams of light. The light flashed and beat about him. Stanford slithered onto the slab of pack ice and rolled onto his back.

All white. Everything. Stanford saw lights in the sky. They were very high up, very small, pulsating and glowing. He knew what the lights were. He smiled when he saw them. The lights were like stars in the white sky, very bright and intense. Stanford lay there on the pack ice. The ice drifted imperceptibly. Stanford lay there and let the frost encase him and grow into more ice. The lights glided across the sky. They defied the sky's bright haze. The ice drifted and flashed blue and yellow and became part of Stanford. He lay there and smiled. The ice carried him away. He felt a fierce defiance and exultation that would not let him die. The frost thickened and hardened. It molded Stanford to the pack ice. He turned around in the sun, a glass figure, quite beautiful, the light flashing on and off him, exploding, streaming skyward, gradually turning him into a glacier, a prism… a star.

Author's Note

While *Genesis* is a work of fiction, it has been based on certain facts which the author feels are worth bringing to light.

In the course of researching a different novel altogether, I obtained, through the Imperial War Museum in London, two short articles that immediately attracted my attention. The first was a routine war report by Marshall Yarrow, then the Reuters special correspondent to Supreme Headquarters in liberated Paris. This article had been published, among other places, in the *South Wales Argus* on December 13, 1944, and it stated: 'The Germans have produced a "secret weapon" in keeping with the Christmas season. The new device, which is apparently an air defence weapon, resembles the glass balls which adorn Christmas trees. They have been seen hanging in the air over German territory, sometimes singly, sometimes in clusters.

They are colored silver and are apparently transparent.' The second article, an Associated Press release, extracted from the New York *Herald Tribune* of January 2, 1945, illuminated the subject even more. It said: 'Now, it seems, the Nazis have thrown something new into the night skies over Germany. It is the weird, mysterious "Foo Fighter" balls which race alongside the wings of Beaufighters flying intruder missions over Germany. Pilots have been encountering this eerie weapon for more than a month in their night flights. No-one apparently knows what this sky weapon is. The balls of fire appear suddenly and accompany the planes for miles. They seem to be radio-controlled from the ground, so official intelligence reports reveal…'

Intrigued by these reports, I conducted some more research and discovered a highly technical but little known book entitled *Intercettateli Senza Sparare* (see 'Sources' for details) by Renato Vesco, in which the author claims that the 'Foo Fighter' actually existed, that it was originally called the *Feuerball*, and that it was first constructed at the aeronautical establishment at Wiener Neustadt, with the help of the Flugfunk Forschungsanstalt of Oberpfaffenhoffen (F.F.O.) According to Vesco, the *Feuerball* was a flat, circular flying machine, powered by a special turbojet engine, that was used by the Germans during the closing stages of the war both as an anti-radar device and as a 'psychological' weapon against Allied pilots. Says Vesco: 'The fiery halo around its perimeter – caused by a very rich fuel mixture – and the chemical additives that interrupted the flow of electricity by overionizing the atmosphere in the vicinity of the plane, generally around the wing tips or tail surfaces, subjected the H2S radar on the plane to the action of powerful electrostatic fields and electromagnetic impulses.' Vesco also claims that the basic principles of the *Feuerball* were later applied to a much larger 'symmetrical circular aircraft', the *Kugelblitz* (or Ball Lightning Fighter), which was the first example of the vertical-rising, 'jet lift' aircraft.

Further intrigued, I continued my research in West Germany and came up with a surprising number of newspaper and magazine clippings – all from the 1950s – about one *Flugkapitän* Rudolph Schriever. One clipping stated that this *Luftwaffe* engineer had designed, in the spring of 1941, the prototype for a 'flying top' and that the device was tested in June,

1942; another stated that the same *Flugkapitän* Schriever, with 'three trusted colleagues', had actually constructed, in August 1943, a 'large specimen' of his original 'flying disk', but that in the summer of 1944, in the East Hall of the B. M. W. plant near Prague, he had redesigned the original model, replacing its former gas turbine engines with some highly advanced form of jet propulsion; and a third, which reiterated the above information, added the interesting news that original plans for the flying disk had been drawn up by the 'German experts', Habermohl and Miethe, and an Italian physicist, Dr Belluzzo. According to other reports (and, subsequently, to Major Rudolph Luzar's indispensable book, *German Secret Weapons of World War II*, English language editions published by Neville Spearman, London, 1959, and the Philosophical Library, New York, 1959), Habermohl and Schriever had designed a large ring plate with 'adjustable wing-disks' that rotated around a 'fixed, cupola-shaped cockpit', while Miethe had developed a 'discus-shaped plate in which adjustable jets were inserted'. Reportedly, the flying saucer had a diameter of 42 m. ((137.76 ft.), a height from base to canopy of 32 m. (104.96 ft.) and had reached an altitude of approximately 40,000 ft. with a horizontal flight speed of 2,000 km./h. (1,250 mph).

So far, so good… But what I now came to was a series of small but puzzling contradictions.
Shortly after the war, Rudolph Schriever was resident at Hokerstrasse 28 in Bremerhaven-Lehe, West Germany, from where he announced that the flying disk had indeed been constructed, that it had been ready for testing in April 1945, but that with the advance of the Allies into Germany, the test flight had been cancelled, the machine entirely destroyed, and his design papers either mislaid or stolen. Schriever's story was, however, slightly contradicted by alleged eyewitness Georg Klein, who later stated that he had actually *seen* the test flight of the Schriever disk, or one similar, on February 14, 1945. A certain doubt may be cast on Klein's date since, according to the War Diary of the 8th Air Fleet, February 14, 1945, was a day of low clouds, rain, snow and generally poor visibility – hardly the conditions for the testing of a revolutionary new kind of aircraft. Nevertheless, according to Renato Vesco, the test flight of a machine called the *Kugelblitz* – which was rumoured to be a revolutionary kind of supersonic aircraft – was successfully conducted over the underground

complex of Kahla, in Thuringia, *some* time during that February of 1945.
By 1975 *Luftfahrt International* was stating that a certain *Flugkapitän* Rudolph Schriever had died in the late 1950s and that found among his papers were the incomplete notes for a large flying saucer (most of them technically out of date), a series of rough sketches of the machine (some of which had clearly been redrawn and updated just before his death), and several newspaper clippings about himself and his supposed flying saucer.
Now, while none of the designs would have led to a workable flying saucer, *Luftfahrt International* did include reproductions of the designs of both Schriever and Dr Miethe, while also pointing out that Schriever, right up to his death, had been convinced that the UFO sightings since the end of the war were proof that his original ideas had been taken further with successful results.
Could this be true?
Let us examine the possibilities. According to Schriever, what appears to have been the final version of his flying saucer was constructed at the B. M. W plant near Prague in the early months of 1944 and was ready for testing in April 1944. According to Georg Klein, a similar flying disk was actually test-flown near Prague in February 1945; and according to the Italian author, Renato Vesco – who seems unaware of the existence of the Schriever legend – an extraordinary new flying machine called the *Kugelblitz* was test-flown sometime during that same month over the complex of Kahla, in the mountain region of Thuringia.
Tying in with this information is the fact that the gas-turbine section of B. M. W. was originally located in the suburb of Spandau, near Belin – where, according to Renato Vesco, a lot of research on the *Kugelblitz* was undertaken; that it was later moved to the underground plant at Wittringen, near Saarbrucken; but that it finally ended up, as from 1944, in seven enormous underground complexes in both Thuringia and Nordhausen in the Harz Mountains.
That whole area, running in a metaphorical arc from the Harz Mountains, down through Thuringia, Bohmen and Mahren, was to form the German's last redoubt and as such was littered with a staggering number of underground military and scientific complexes, including the immense Mittle-Werke factories and the personnel and equipment from the experimental center at Peenemünde. Certainly, while history was to decree otherwise, it was from there that Hitler intended to defend the remnants of

the Third Reich with ‘a whole underground army’ and the ‘secret weapons’ he had been promised for so long.

In May, 1978, at Stand 111 in a scientific exhibition in the Hanover Messe Hall, some gentlemen were giving away what at first sight appeared to be an orthodox scientific tabloid newspaper called *Brisant*. This contained two seemingly unrelated articles: one on the scientific future of Antarctica, the other about Nazi Germany’s World War II flying saucers. The flying saucer article reiterated the information mentioned above, but added that the research centers for ‘*Projekt Saucer*’ had been located in the areas of Bohmen and Mahren.

Regarding this, it should be noted that Prague is in Bohmen, and that Bohmen is more or less surrounded by the metaphorical arc of the Harz Mountains, Thuringia and Mahren – all of which areas contained vast underground research complexes, none of which were more than a few hundred kilometers from Prague.

The article also included reproductions of detailed drawings of a typical Second World War flying disk, did *not* mention the designer’s name, and claimed that the drawings had been altered by the West German government to render them ‘safe’ for publication. Adding weight to this claim, the unnamed author then pointed out that during the Second World War all such inventions, whether civilian or military, would have been submitted to the nearest patent office where, under paragraphs 30a and 99 of the *Patent-und Strafgesetsbuch*, they would have automatically been stamped ‘Secret’, taken away from their rightful owners, and passed on to Heinrich Himmler’s SS research establishments… and, according to the article, at the end of the war some of those patents disappeared into secret Russian files, others into equally secret British and American files, and the remainder would possibly have disappeared with various ‘missing’ German scientists and SS troops.

(Since neither the British, the Americans or the Russians are ever likely to reveal what, precisely, was discovered in the secret factories of Nazi Germany, it is worth noting that in 1945 Sir Roy Feddon, as leader of a technical mission to Germany for the Ministry of Aircraft Production, reported: ‘I have seen enough of their designs and production plans to realize that if they had managed to prolong the war some months longer, we would have been confronted with a set of entirely new and deadly developments in air warfare.’ And by 1956, Captain Edward J. Ruppelt,

then head of the U.S. Air Force's Project Blue Book, was able to state: 'When World War II ended, the Germans had several radical types of aircraft and guided missiles under development. The majority of these were in the most preliminary stages, but they were the only known craft that could even approach the performances of the objects reported by UFO observers.')

The *Brisant* article went on to point out that in 1938, Hitler, anxious for a foothold in the Antarctic, sent an expedition commanded by Captain Alfred Richter to the coast due south of South Africa. Daily for three weeks two seaplanes were catapulted from the deck of the German aircraft-carrier *Schwabenland*, with orders to fly back and forth across the territory that Norwegian explorers had named Queen Maud Land. The Germans made a far more thorough study of the area than the Norwegians had done, finding vast regions that were surprisingly free of ice. This job done, they renamed the whole area *Neuschwabenland* and claimed it as part of the Third Reich. According to *Brisant*, German ships and U-boats continued to prowl the South Atlantic Ocean, particularly between South Africa and the Antarctic, throughout the whole of the Second World War. Then, in March, 1945, just before the end of the war, two German provision Uboats, U-530 and U-977, were launched from a port on the Baltic Sea. Reportedly they took with them members of the flying saucer research teams, the last of the most vital flying saucer components, the notes and drawings for the saucer, and the designs for immense underground complexes and living accommodations based on the remarkable underground factories of Nordhausen in the Harz Mountains. The two U-boats duly reached Neuschwabenland, more correctly known as Queen Maud Land, where they unloaded. Finally, two months *after* the war, the same U-boats surfaced mysteriously off the coast of Argentina where the crews were handed over to the American authorities, who interrogated them at length and then flew them all back to the United States.

About a year after this, the United States launched the biggest operation ever known regarding the Antarctic. While the stated purpose of the operation was to 'circumnavigate the 16,000-mile Antarctic coastline and map it thoroughly', *Brisant* found it odd that Operation Highjump, under the command of Antarctic veteran Admiral Richard Evelyn Byrd, included thirteen ships, two seaplane tenders, an aircraftcarrier, six twin-engine R4D transports, six Martin PBM flying boats, six helicopters and a staggering

total of 4,000 men. It was also considered odd that when this virtual assault force reached the Antarctic coast, it not only docked, on January 27, 1947, near the Germanclaimed territory of Neuschwabenland, but then divided up into three separate task forces.

That expedition became something of a mystery. Subsequent official reports stated that it had been an enormous success, revealing more about the Antarctic than had ever been known before. However, many other, mainly foreign, reports suggested that such in fact had not been the case: that many of Byrd's men were lost during the first day, that at least four of his airplanes inexplicably disappeared, and that while the expedition had gone provisioned for six to eight months, the men actually returned to America in February 1947, after only a few weeks. According to *Brisant*, Admiral Byrd later told a reporter (I could find no verification for this) that it was 'necessary for the USA to take defensive actions against enemy air fighters which come from the polar regions' and that in the case of a new war the USA would be 'attacked by fighters that are able to fly from one pole to the other with incredible speed'. Also, according to *Brisant*, shortly after his return from the Antarctic, Admiral Byrd was ordered to undergo a secret crossexamination – and the United States withdrew from the Antarctic for almost a decade.

What was being suggested, then, is that throughout the course of the Second World War the Germans were sending ships and planes to the Antarctic with equipment for massive underground complexes, that at the end of the war the flying saucer project's team of scientists were taken by submarines U-530 and U-977, that the Americans interrogated the crews of those submarines when they docked in what they had assumed was a friendly Argentina, that the Americans then, upon hearing about the Antarctic base, organized a military task force disguised as an exploratory expedition, that the expedition was subsequently put to disarray when it came up against the extraordinary German flying saucers, and that the United States then pulled out of the Antarctic temporarily, in order to build their own saucers based on the designs found in Germany after the war.

The second article was also of interest. It was, in point of fact, a rather crude propaganda statement masquerading as a scientific review of Antarctic potential. Dusting off the already well known topographical facts, what one was left with was an insistence that the Democratic Republic of Germany should claim back their rights to that part of the Antarctic which

the Nazis stole from the Norwegians and arrogantly renamed *Neuschwabenland*.

Taking note of the National Socialist leanings of the article, bearing in mind the fact that *Brisant* had been published by a company that had since disappeared (*Lintec*, GmbH, Jungfrauenthal 22, D-200 Hamburg 13), and reminding myself that the whole theory had suspicious parallels with the more far-fetched 'Holes in the Poles' UFO myths, I nevertheless checked up on other aspects of the article and discovered that the Germans had in fact been patrolling the Antarctic regions of the South Atlantic Ocean throughout the war. Indeed, two years after the Richter expedition, a couple of Norwegian whaling ships were seized by boarding parties from the German raider *Pinguin* as they rested at anchor in their own territorial waters just off Queen Maud Land. Within hours of that incident, a Norwegian supply ship and most of the nearby whaling convoy had been lured into the trap – and the war in Antarctica was underway. In May 1941 HMS *Cornwall* located and sank the *Pinguin*, but not before *Pinguin* had captured a whole string of Allied merchant ships totalling more than 135,000 tons. What is also historical fact is that *Pinguin's* sister ships, appropriately named *Komet* and *Atlantis*, continued to prowl the Antarctic shores until the end of the war.

Regarding the two submarines, I also came across some intriguing information. U-977, under the command of Captain Heinz Schaeffer, did in fact leave Kiel harbour in the Baltic Sea in April, 1945, stopped in at Christiansund South on April 26, left there the following day, and was not seen again until it surfaced at Mar del Plata, Argentina, on August 17, 1945 – a period of nearly four months.

Where was the submarine all that time? According to Captain Schaeffer, they had left with the intention of patrolling the South Atlantic, had docked for fuel at Christiansund South the following day, and had then, several days later, heard over their radio that the war was over. Convinced that he would not be treated too kindly by the Allied Command, Schaeffer gave his crew the option of being put off along the coast of Norway or travelling on with him to what he thought was a friendly Argentina. Since some of the crew preferred to return to Germany, the next few days were spent in hugging the Norwegian coastline until, on May 10, they dropped some of their men off on the mountainous coast not far from Bergen. This done, according to Schaeffer, he and the remaining crew embarked upon what

surely must have been one of the most remarkable naval feats of the war: a journey through the North Sea and the English Channel, past Gibraltar and along the coast of Africa, finally surfacing, all of sixty-six days later, in the middle of the South Atlantic Ocean. During the next month they alternated between floating on the surface and diving back to the depths, once even surfacing off the Cape Verde Islands and going ashore on Branca Island, another time going so far as to 'disguise' the submarine when it was on the surface by rigging up false sails and funnel to make it look more like a cargo steamer. Finally, when close to Rio de Janeiro, they heard over their radio that another fleeing German submarine, U-530, had put into the River Plate and that its crew had been handed over to the United States as prisoners of war. Disturbed by this news, they nevertheless put into Mar del Plata on August 17, 1945
– nearly four months after they had put out from Kiel harbour.
This rather fantastic story was recounted by Captain Schaeffer to the Argentine authorities when they interrogated him on three specific issues: (1) Where had U-977 been when the Brazilian steamer *Babia* was sunk? (2) Why had U-977 arrived in Argentina so long after the war ended? And (3) Had U-977 carried anyone 'of political importance' during its voyage to the Argentine? Schaeffer denied that he had been anywhere in the area of the *Babia* when it was sunk, explained his late arrival in Argentina with the fantastic story I have just recounted, and stated that no one 'of political importance' had ever been aboard U-977.
What is particularly intriguing about all this is that a few weeks later an Anglo-American committee, composed of high-ranking officers especially flown to the Argentine to investigate 'the mysterious case' of U-977, spent a great deal of time interrogating Schaeffer regarding the possibility that he might have taken Hitler and Martin Bormann aboard his U-boat, first to Patagonia and then to a secret Nazi base in the Antarctic. Indeed, they were so insistent on this that they subsequently flew Schaeffer and his crew – *and* Otto Wehrmut, commander of U-530
– back to a prisoner of war camp near Washington, DC, where for months they continued their interrogations. While I could find no record of the fate of Commander Wehrmut, what I did authenticate is that Schaeffer repeatedly denied having shipped anyone where… Nevertheless, he was then handed over to the British in Antwerp and *again* interrogated for many months.

Assuming that Schaeffer was telling the truth and that the Allies found nothing unusual in Schaeffer's U-boat, it seems rather strange that the Americans would later send the submarine back to the United States where, under direct orders from the U.S. War Department, it was blown to pieces with torpedoes. As for Schaeffer, he was eventually returned to Germany, did not feel comfortable as one of the conquered, and then went back to join some fellow Germans in Argentina.

The possibility remains that Schaeffer might have been lying. For a start, it is decidedly odd that two insignificant German U-boats should have stirred such monumental interest amongst the Allies. It is also worth considering why the Allies would even have imagined that Hitler and Martin Bormann – or anyone else, for that matter – would have fled to such an unlikely place as the Antarctic. Finally, it is worth noting that Schaeffer had spent much of his career protecting the research centers at Regen and Peenemünde, that he was highly experienced at patrolling the South Atlantic and polar regions, and that he was one of a select group of Naval officers who were sent to the Harz Mountains to study the new, reportedly highly advanced, XX1 electric submarines. Schaeffer was, in other words, a man familiar with the 'secret' projects of the Harz Mountains – and a man ideally suited to make the long voyage to the Antarctic.

Now let us review the situation. It is not confirmed, but is very possible, that the German *Feuerball* existed, that it accounted for the first modern UFO sightings during the Second World War, and that an extraordinary supersonic flying machine, the *Kugelblitz*, was successfully test-flown in Germany a few weeks before the war ended. The *Feuerball*, therefore, could have been the forerunner of the small, seemingly remote-controlled UFOs (the Foo Fighters), while the *Kugelblitz* could indeed have been the first of the larger, piloted flying saucers.

The unsigned flying saucer designs reproduced in *Brisant*, and in many more orthodox journals, mentioned materials not in existence, as far as we know, during the war years. This suggests that they could have been reproductions of the original designs that *Flugkapitän* Rudolph Schriever updated just before his death in the late 1950s. Assuming, then, that Schriever's 'mislaid' or 'stolen' notes and designs were actually in the hands of the SS, it is possible that they were secretly developed in one of the many underground complexes in the area of the aborted last redoubt – either the Nordhausen complex in the Harz Mountains or at Kahla in nearby

Thuringia; that the completed saucer was test-flown in the early months of 1945; and that it was then destroyed as the Allies advanced into Germany.
We know from reproductions of the work of Schriever, Bulluzzo and Miethe that a flying saucer project, no matter how primitive at the time, was definitely on the list of German military priorities. Regarding the fact that the only evidence for such machines is the evidence presented above, it should be borne in mind that the most fanatical of Himmler's SS were controlling the research centers in the areas mentioned, that as they retreated they attempted to destroy as much as possible of their most important scientific papers and inventions, and that thousands of slave workers and their SS overlords – who could have revealed a great deal more – disappeared in the chaos of the liberation and were not seen again.
Could some of them have gone to the Antarctic?
Contrary to the accepted view, it is actually quite possible that the Nazis continually shipped and flew vital men, material and documents to the Antarctic throughout the war years.
Regarding the possibility of the submarines of that time being able to complete such a lengthy voyage, it is to be noted that the normal Uboat could cover 7,000 miles on each operational cruise, that the Germans had submarine tankers spread across the South Atlantic Ocean at least as far as south of South Africa, and that any one of those tankers, which had a displacement of 2,000 tons, could have supplied ten U-boats with fuel and stores, thus trebling the time that those Uboats could stay at sea.
Regarding the possibility of the Germans building self-sufficient underground research factories in the Antarctic, it has only to be pointed out that the underground research centers of Nazi Germany were gigantic feats of construction, containing wind-tunnels, machineshops, assembly plants, launching pads, supply dumps and accommodations for all who worked there, including adjoining camps for the slave workers – and yet very few people knew that they existed.
Given all this, it is in my estimation quite possible that men and materials were shipped to the Antarctic throughout the war, that throughout those same years the Germans were engaged in the construction of enormous underground complexes in Neuschwabenland similar to those scattered around the last redoubt, and that the American, Russian and British 'cover-up' regarding UFO sightings could be due to the reasons suggested in this novel.

Sceptics would argue that the major histories of the Third Reich either ignore or pass off as ridiculous any stories about Nazi Germany's 'secret' weapons, but such an argument can be countered by reminding the reader that most of the secret weapon projects were well hidden by the SS and that much of what the Allies discovered remains classified to this day.

While Albert Speer, the Third Reich's Minister of Armaments and War Production, was sceptical about the 'secret weapons' in his eloquent book *Inside the Third Reich* (Weidenfeld & Nicolson, London, 1970), he *did* admit that there was increasing speculation about such weapons during the closing months of the war; and that while he himself stated at the time that there were not enough basic materials for the production of such, he had, in his own words, 'underestimated… the large stocks of material that had been accumulated in the factories'. Speer was also sceptical when Robert Ley, the Minister for Labor, excitedly told him, in April, 1945, that his German scientists had invented a 'death ray' (possibly a laser weapon); this is interesting when one considers the fact that Captain Heinz Schaeffer, captain of the submarine U-977, stated in his book, *U-Boat 977* (William Kimber, London, 1952) that in April 1945 an SS associate had offered *him* a demonstration of a so-called 'death ray'. It is unfortunate that Schaeffer, in a hurry to return to Kiel for his famous last voyage, had no time to remain in Berlin and check out the validity of his friend's claim.

For the purposes of fiction I have utilized the real-life personages, SS Generals Hans Kammler and Artur Nebe. Readers might therefore be interested in knowing that while Nebe was placed on a Nazi 'death list' after the attempted assassination of Hitler, his death was never actually confirmed and many felt that he had simply fled for his life. As for General Hans Kammler, his history with the SS and the V-1 and V-2 rockets is well documented, but what became of him after he disappeared from Germany in April 1945 remains a mystery to this day.

Regarding the members of the German flying saucer team, Schriever and Belluzzo are now dead, Habermohl was reported to have been captured by the Russians (thus the American military's fear of *Russian* saucers shortly after the war), and – perhaps most interesting – Miethe, who stated to the press that he had worked on *Projekt Saucer*, went to work for the Americans and Canadians.

Finally, for the record, the prototype for the AVRO flying saucer, which was handed over to the U.S. and loudly proclaimed to have been a failure, is

now (at the time of writing) on show in the U.S. Air Force Museum in Fort Eustis, Virginia.
Thus, while *Genesis* is a work of fiction, it is based on some intriguing facts… and those facts could do with further investigation.
A list of sources is given overleaf.

Sources

The earliest article about the German 'foo fighter' was published in the *South Wales Argus* of December 13, 1944. An Associated Press release by Marshall Yarrow (Reuters special correspondent at Supreme Headquarters, Paris, France) was published in the New York *Herald Tribune* of January 2, 1945. Another article was published in the London *Daily Telegraph*, also on January 2, 1945.

Information about *Flugkapitän* Rudolph Schriever and his fellow officers on Nazi Germany's *Projekt Saucer* came mainly from the following magazine articles: 'Untertassen – Flieger Kombination', *Der Spiegel*, March 30, 1950. 'Fliegende Untertasse in Deutschland erfunden', *Sonderbericht der Deutschen Illustrierte*, S.1350, 1951. 'Fliegende Untertassen – eine Deutsche Erfindung', *Die sieben Tage*, No. 26, June 27, 1952. 'Die Deutsche Fliegende Untertasse', *Das Ufer – die Farb-Illustrierte*, No. 18, September 1, 1952. 'Erste Flugscheibe flog 1945 in Prag', *Welt am Sonntag*, April 25, 1953. 'Wunderwaffen 45', *Bild am Sonntag*, February 17, 1957. 'Die UFOs – eine Deutsche Erfindung', *Das neue Zeitalter*, October 5, 1957. 'Flugkreisel, irdisch', *Heim und Welt*, No. 14, April 2, 1959. 'Deutsche UFOs schon 1947/48 einwandfrei beobachtet', *Das neue Zeitalter*, February 6, 1965. 'Deutsche Flugkreisel', *Luftfahrt International*, No. 9, May-June, 1975. 'Mit UFOs zu neuer Gravitationstheorie', *Kurier*, November 20, 1976. 'Fliegende Teller statt Hubschrauber', *Hobby*, December 14, 1977. 'Fliegende Scheiben und Viktor Schauberger', *Kosmische Evolution*, No. 4, 1979. 'Prototypen der Kreisflügler AS 6 V 1', *Luftfahrt International*, No. 4/ 1979.

Books on rocket and aircraft development include: *Soviet Rocketry* (David & Charles, Newton Abbot, 1971) by Michael Stoiko. *The Papers of Robert H. Goddard* (McGraw-Hill, New York, 1970), edited by E.C. Goddard. *The*

Birth of the Missile: The Secrets of Peenemünde (Harrap, London, 1965) by E. Klee and O. Merk. *German Guided Missiles* (Ian Allan, London, 1966) by R. F. Pocock. *V2* (Hurst and Blackett, London, 1954) by Walter Dornberger. *Hitler's Last Weapons: The Underground War Against the V1 and V2* (Julian Friedmann, London, 1978) by Jozef Garlinksi. *Raketon-Flugtechnik* (Edwards Press, Ann Arbor, Michigan 1945; reprint of 1933 edition, published by Oldenbourg of München) by E. Sanger. *Alsos* (Schuman, New York, 1947) by Samuel A. Goudsmit.

The indispensable book on the development of disk-shaped aircraft is *Intercettateli Senza Sparare* (E. Mursia & Co., Milan, Italy, 1968) by Renato Vesco. This was later published in an English translation by Grove Press, New York (1971) under the title *Intercept - But Don't Shoot*, then reissued in 1974 by Zebra Publications, New York, as *Intercept UFO*. Unfortunately it has been out of print for years. A short but decent article on *Projekt Saucer* and related projects is to be found in *German Secret Weapons of World War II* (Neville Spearman, London, 1959; the Philosophical Library, New York, 1959) by Major Rudolph Lusar. Most of Lusar's article is reproduced with other German flying-saucer material and considerable wishful thinking in *UFOs: Nazi Secret Weapons?* (Samisdat, Toronto, Canada, undated) by Mattern Friedrich, aka Ernst Zundl.

The most comprehensive studies of the UFO phenomenon as a whole are *The UFO Controversy in America* (Signet, New American Library, New York 1975) by David Michael Jacobs; and *UFO Exist!* (Ballantine, New York, 1976) by Paris Flammonde. Both of these books include detailed accounts of the Great Airship Scare of 1896-97. *The Report on Unidentified Flying Objects* (Doubleday, New York, 1956) by former Project Blue Book head, Captain Edward J. Ruppelt, is the classic book of its period; and its natural companion is *Project Blue Book* (Ballantine, New York, 1976), edited by Brad Steiger. For purely scientific, or pragmatic, examinations of the phenomenon, one can do no better than Dr J. Allen Hynek's authoritative works, *The UFO Experience: A Scientific Inquiry* (Abelard-Schuman, New York, 1972; Corgi, London, 1974) and *The Hynek UFO Report* (Dell, New York, 1977; Sphere, London, 1978).

Other UFO books relevant to this subject are: *UFOs: A Scientific Debate* (Norton Library, New York, 1974), edited by Carl Sagan and Thornton Page. *The Crack in the Universe* (Neville Spearman, Jersey, 1975) by Jean-Claude Bourret. *UFOs From Behind the Iron Curtain* (Souvenir Press, London, 1974) by Ion Hobana and Julien Weverbergh. *The Interrupted Journey* (Berkley Medallion, New York, 1974) by John G. Fuller. *Beyond Earth: Man's Contact with UFOs* (Corgi, London, 1974) by Ralph Blum with Judy Blum. *The Humanoids* (Neville Spearman, London, 1969; Futura, London, 1974/77), which is a compilation of articles from *Flying Saucer Review*, edited by Charles Bowen. *Celestial Passengers: UFOs & Space Travel* (Penguin, London, 1977) by Margaret Sachs and Ernest Jahn. *Socorro Saucer* (Fontana, London, 1976) by Ray Stanford.

The famous monthly magazine *Flying Saucer Review* is mandatory reading for anyone interested in the subject, but should be perused with a highly selective eye.

I am indebted to NASA's *Exploring Space With a Camera* and to their reproductions and analysis of the much abused ESSA 7 satellite photographs. I am also heavily indebted to Eliot Porter's *Antarctica* (Hutchinson, London, 1979) in which both text and photographs are magnificent.

The indispensable book on UFO technology is *UFOlogy* (Celestial Arts, California, 1976) by physicist James M. McCampbell. Articles on the subject, and related articles, are to be found in the excellent *Worlds Beyond* (An/Or Press, the New Dimensions Foundation, Berkeley, California, 1978), edited by Larry Geis and Fabrice Florin, with Peter Beren and Aidan Kelly. Information on CAMS, cyborgs, other man-machine interactions, and general bioengineering and various nightmarish experiments was found in: *As Man Becomes Machine* (Abacus, London, by David Rorvik. *Man Modified* (Paladin, London, 1969) by David Fishlock. *The People Shapers* (Futura, London, 1978) by Vance Packard. *Manipulation* (Fontana, London, 1975) by Erwin Lausch. *The Immortalist* (Panther, London, 1973) by Alan Harrington. *PSI: Physic Discoveries Behind the Iron Curtain* (Abacus, 1977) by Sheila Ostrander & Lynn Schroeder. *Future Science* (Anchor Books, Doubleday, New York, 1977), edited by John White and Stanley

Krippner. *Robots: Fact, Fiction and Prediction* (Thames and Hudson, London, 1978) by Jasia Reichardt.

U-Boat 977 (William Kimber, London, 1952) by Heinz Schaeffer includes that submarine commander's personal account of his final voyage to Argentina. *The Hollow Earth* (Citadel Press, New Jersey, 1969), by Dr Raymond Bernard is the standard, but hardly credible, book on this bizarre theory. Another book, *This Hollow Earth* (Sphere, London, 1972) by Warren Smith, is even less credible. *Secret Nazi Polar Expeditions* (Samisdat, Toronto, undated) by Christof Friedrich, alias Ernst Zundl, is a neo-Nazi view of this subject which, combined with the aforementioned *UFOs: Nazi Secret Weapons*, by the same author writing under a different pseudonym, is almost certainly responsible for the articles published in the neo-Nazi magazine, *Brisant*, in May 1978.

My thanks to the following libraries and universities for their kind assistance in gathering further research material: Cornell University, New York; the Massachusetts Institute of Technology (MIT), Massachusetts; the University of London; the British Museum Library, London; the Imperial War Museum, London; the Württembergische Landesbibliothek, Freiburg im Breisgau; and the Staats-und Universitätsbibliothek, Hamburg.

Personal thanks to Stephanie Trudeau in New York; Willi Mayer, Reinhold Stoll, and Ruediger and Hannelore Vogt of West Germany; Mark Williams of *Lookout* magazine, Spain; Martin Atcherley for his kind assistance regarding Paraguay and Argentina; James Webb for his authoritative response to my enquiries about the SS and the Occult; Richard and Iris Gollner, my agents and incidental researchers; Nick Austin for his generosity with certain books; and Alan Earney, for so enthusiastically backing this whole project.

W.A.Harbinson London, 1980

PROJEKT UFO

The Case for Man-Made Flying Saucers W. A. Harbinson

W.A.Harbinson's groundbreaking non-fiction work, *Projekt Saucer: The Case for Man-Made Flying Saucers*, details the extraordinary facts behind his bestselling novel, *Genesis.* Widely regarded as one of the most detailed and level-headed books ever published on this controversial subject. *Projekt UFO* is also considered by many to offer the definitive explanation for a mystery that has haunted the Western world for over sixty years. Now this revelatory book about 'the world's most fearsome secret', first published in 1995, is again available to a worldwide readership.

This new edition has been updated by the author.

'A fascinating account of the history of UFOs, but from the perspective of their being man-made, not extraterrestrial craft... Forget ETs and invasions from space; the terrestrial scenarios Harbinson speculates are already frightening enough!'

-*Nexus*

'For sheer content and quantity, this book must score ten out of ten. It covers a multitude of topics including biblical encounters, airship scares, spinning disks, World War II sightings, UFO landings, UFOnauts, and much more. A very worthwhile addition to your stack of bedtime reading.'
